For the purpose of reference, the two systems of heat energy will be separately described as the "constant load" and the "intermittent load." The "constant load" is dealt with from the local furnace, and the "intermittent load" electrically. The "constant load" requires the provision for 52 weeks of constant hot water at 160 deg. F. for domestic purposes, and a means of interior air heating at 55 deg. F. during 26 weeks. The "intermittent load" requires provision for raising the temperature of "constant load" hot water as and when required for cooking and other purposes; the provision of radiant electric heat for topping up the "constant load" temperature in the principal living rooms to 65 deg. F., or for dealing with the spring and fall intermittent load when the "constant load" is shut down; the production of light combined with radiant heat energy, or a reproduction by electricity of the cheerful coal or log fire with radiant heat.

With the "colectric" system the disadvantages inherent in both systems automatically disappear, no artificial humidity is needed and ventilation is simplified. The necessary constant-load convectors are not of sufficient dimensions to make their existence known. The electric radiant glowing fire in a room, whether it is being used at the moment for "topping up" the temperature or not, gets all the credit. The possibility of instantaneously providing a glowing fire and "topping up" with radiant heat where the outside temperature is at or below freezing point and the inside temperature uniform at 55 deg. F. is a luxury so delightful that it is good to know it is within such easy reach. The benefit to health to be derived from sitting in direct radiant heat of short wave-lengths is undeniable. The blood circulation is improved, breathing is deeper and waste matter is expelled more actively by the lungs.

The "Colectric" home is provided with one chimney only. The saving on the simplified construction will completely pay for the installation of the central-heating plant and hot-water system. It is usual in such systems to include convectors in the bedrooms, but since we employ a secondary means of heating, the piping and accessories can be omitted in the upper rooms of the house. The saving thus effected is estimated to more than cover the cost of the electric wiring. The boiler should be of the high-efficiency type in which the central heating water only flows through it. Convectors should be run off from this supply to the living rooms, and hall, or passages, of sufficient heating surface to ensure that the temperature does not fall below 55 deg. F. on the coldest days. Unless required for drinking purposes, it will never be necessary to bring water to the boil from cold. For washing clothes, cooking, and so on, hot water should be used from the tap, and by means of electricity the necessary additional heat for boiling or simmering be applied.

The temperature of the already partly heated living room is "topped up" when required by electric radiation. Here the spectacular effect plays an important part, and it will be very often experienced that no electrical heat is required at all so long as the brilliance of a natural coal fire is maintained. It is this particular feature, controlled from the door, which is so attractive. A combination such as described provides a luxurious method of living under perfect temperature control, and within the means of the humblest purse. The "Colectric" system opens up an entirely new field for the larger class of private installation, as the power required for the intermittent or "topping-up" load can well be supplied by a plant of moderate size. The significance of this application is of vast importance. It means that an electrified home is the most practical proposition regardless of situation.

In certain places where a cheap price for energy is quoted, electrically heated water may be introduced with considerable success. Very great care is needed in the initial layout of any such scheme in order that it may function at the maximum efficiency for a given type of load. There can be much said in favour of the local storage tank. The chief defect from the consumer's point of view is the limited hot-water output and the time-lag in heating up afresh. To mitigate as far as possible this trouble, a tank of fairly large capacity must be installed to meet the maximum demands likely to occur during the day.

An alternative all-electric system is the central-storage or pressure-type calorifier thermostatically controlled. The tank in this case can be of a much greater capacity and should be placed as near as possible to the central position relative to the draw-off taps. All such tanks should be well lagged. It is interesting to recall that the radiation per square foot of surface of an unlagged tank working at 150 deg. F. represents an electric consumption of about 30 to 40 watts. In round figures this is equivalent in a 25-gal. tank to a loss of about a quarter of a unit per hour, or approximately 40 units per week. For a polished copper tank the loss is about half. The system has an obvious advantage over local storage, inasmuch as hot water is available to full capacity at any tap to which it may be connected. A dual purpose can be served if the tank is placed in a linen cupboard. It is important to keep the flow pipe runs as short as possible.

Discussion.

Mr. L. L. ROBINSON, Hackney, opening the discussion, said that for many years he lived in an all-electric flat, and during the past year he had been living in the country in a house which had been so designed that it might become all-electric as soon as the power was available. One thing he had learned was that the all-electric house was much cheaper, where the current was sold at a reasonable rate. He thought Mr. Berry would have to extend his investigations so that they could put the all-electric house within the reach of poor people. He was inclined to advocate a system which allowed the public to heat water and do their cooking by electricity in the summer, and which would enable them to get back to solid fuel in the winter.

Mr. G. WILKINSON, Harrogate, said he had had an all-electric house for 25 years, and had got precisely the system

advocated in the paper, but it could only be justified if one owned his house and not if it were rented. For lighting alone he used less than 3 per cent., for cooking just under 20 per cent., for hot water over 20 per cent., and for room heating 57 per cent.; out of the total of energy consumed no less than 77 per cent. was what he called low-grade heat—something less than boiling point—which could be stored. He suggested that they might introduce a "change circuit" system for getting cheaper electricity, a circuit which was laid out in a very circumscribed area, and took in a spasmodic way the amount of energy which could be supplied between the normal and the top load.

Lady Brooks, C.B.E., the President of the Birmingham and Midland Branch of the E.A.W., said Mr. Berry's paper was an extraordinarily practical one from the woman's point of view. In the future they were going to receive with open arms everything electrical, but for the moment that was impossible. They wanted closer co-operation with the architects and builders.

Dr. S. Z. de Ferranti recognised that it was a most contentious subject. Some people would not give up their open coal fire at any price, but they were out of date or shortly would be. He looked upon the system which Mr. Berry advocated as a makeshift; years ago he had the "Colectric" system, a central system of heating at a low temperature with a water radiator in every room and a furnace in the basement, and "to put it bluntly, we got fed up with it" owing to fumes from the coke furnace. If Mr. Berry said the all-electric house was the ultimate solution he would agree with him, but they must have storage capacity. The output of electricity undertakings would be increased not ten times, but a great deal more when all the requirements of the public were properly met.

Mr. T. Hall, Burton-on-Trent, said that for electricity for heating and cooking they had received £10,000 this year; they were educating people to use electricity for everything they possibly could. He urged the importance of introducing a satisfactory system of storage, and said he was trying out several experiments in the breweries with this object in view. The demands of the breweries for hot water were enormous; one brewery wanted 2,000 or 3,000 kW for this purpose.

Mrs. Gregory, of West Ham, stressed the point that the people into whose homes they wanted to get electricity were not those who could afford it, but the millions of homes of the workers who would enjoy and appreciate its advantages. They were educating the people of the country with regard to electricity, but she felt that a good many of the men on electricity committees also wanted educating, and it would be useful if more women were members of municipal electricity committees to give the woman's point of view. It was time the engineers found a way of getting the appliances cheaper.

Ald. H. G. Odell said from the discussion it seemed to him that they were going to throw over the slogan of the "all-electric house" and were going in for a sort of half-way house. But they must have no compromise, they must go for the all-electric house, which was practical, popular, and much appreciated. At Ilford they had received letters expressing satisfaction not only with the electrical service, but also with the cost of it. The main thing was to get the prices right and make the service attractive.

Mrs. A. L. Hayes said if they could get a cheaper supply of electricity and cheaper apparatus they would better help the masses. Mr. Berry's plan was not going to help the masses who were living in present-day houses.

Mr. W. A. Gillott said the system proposed by the author would not increase the output of electricity, and drew attention to the value of a coal fire for the destruction of household refuse.

Mrs. H. C. Lamb said they had adopted Mr. Berry's plan and had some of his "Magicoal" fires on approval. Many of their friends had come in and told them what a lot of heat there had been from these fires (when there had been no heat at all). They had been able to keep their friends warm for twenty hours at a cost of a penny. As soon as the women realised what a thick cloud they were putting between the sun and their own children, the domestic fire would disappear. It was the work of the E.A.W. to educate people in this direction. The problem of disposing of refuse must not be lost sight of.

Mr. D. M. Peattie, of Manchester, considered that the cost of supplying energy for radiators was too high.

Mrs. H. A. Howie, of Walsall, asked what was the use of going on building houses "in the same silly old way." They wanted more women on the Housing Committees, and in the E.A.W.

Mr. F. W. Purse supported the idea of making a compromise until they could reach a perfect system.

Councillor J. Thickett, of Walsall, said there was no doubt about the all-electric house being the ideal, but thousands in this country could not even afford gas. Why did they not bring the cost within the limits of the poor?

Mr. E. Kilburn Scott gave his experiences in Pittsburgh, where they had central heating by steam, and suggested that electrical undertakings should sell steam as well as electricity. A great many existing power stations were out of date, but the boilers could be used to supply steam.

Mr. Berry, in reply, said that the all-electric home was the high ideal.

Alderman Mrs. Hammer, of Hackney, in proposing a vote of thanks to Mr. Berry, said much had been done, and could be done, by wiring and hiring schemes.

The Annual Dinner.

The annual dinner was held at the Buxton Pavilion; Mr. R. W. L. Phillips (president) was in the chair, and there was a large attendance of members and ladies.

After the toast of "The King" had been honoured, Sir Harry Haward, proposing "the I.M.E.A.," congratulated the Association upon its successful work, and extended on behalf of the Electricity Commissioners their best wishes for the future. They recognised the value of such an Association as a means of focusing the ideas and opinions of the 350 local authorities which were operating electricity undertakings, pooling their experiences, providing opportunities for the collective expression of opinion and collective action where such was desirable, and above all things, conducing to a breadth of vision on the part of individual engineers and chairmen of committees which did not come from the mere study of the local undertakings. Such pleasant gatherings as that dinner formed a welcome contract to some of the thorny questions with which the Electricity Commissioners had to deal, and which demanded the wisdom of a Solomon, but unfortunately they were without his power of decision to cut the baby in half. It was impossible to please everybody, but they tried to base their decisions on engineering and technical considerations and not upon party politics or policy. He thought the public generally was not really aware of the extent to which the supply of electricity in this country was dependent upon the efforts of the local authorities. No less than £150,000,000 represented the capital expended by local authorities on their electricity undertakings. During the last year over which statistics were available, he found that only 17 undertakings made calls upon the local rates, totalling about £18,000, whereas 107 undertakings contributed to the rates a sum of £772,000. The Act of Parliament passed last session, like its predecessor the Act of 1919, was a great landmark in the history of the supply industry in Great Britain. He would not hazard a speculation as to what would have been the position in 1926 if the Electricity Commissioners had been able to carry out the intentions and hopes of the sponsors of the measure of 1919; they did their best with the limited powers that Parliament gave them, striking the keynote of co-operation between themselves and the local authorities, and between the local authorities and the companies, but they encountered difficulties and delays of no ordinary kind. By meetings of joint boards of electricity authorities they managed to get them together in some fashion, but there was only one case in which a real union between the parties was effected, and that was in the Midland district. Then came the Central Board, and every undertaking, large and small, would have to look to the Board for its supplies of electricity. With reference to the owners of the selected stations, who would be the pivot of the new system, they felt that all indications pointed to a spirit of co-operation on their part with the Commissioners and the Central Board in working a national scheme. He made an earnest appeal to the owners of the smaller undertakings, as to whose attitude to the new state of affairs he was not quite certain, that they should cordially co-operate with the Commissioners and the Central Board in making this great national effort a success. The sooner all came in the better it would be for them and for everybody else. The great problems that faced the electrical undertakings were those connected with distribution; and here surely there was enough work for the most energetic and enthusiastic engineer. The problem of the domestic load was a pretty tough one for the electrical undertakings; the Electricity Commissioners indulged in a vain hope that they might get advice from the Advisory Committee as to what was an ideal tariff, but unfortunately they drew a blank. Electrical undertakings should be in a position to supply the domestic load when they got it, and he had very grave doubts as to whether many undertakings were adequately equipped in that respect. Vision was needed in all branches of the industry.

Responding to the toast, the President said that King Solomon did not cut the baby in half, but he had heard that recently the Commissioners had cut something in half—that was the period for the repayment of loans. As to his plea that all undertakings should do their best to work under the Act, he could assure Sir Harry that they had been working under very awkward legislation for the last thirty or forty years and were used to it. However difficult this Act was to work, they would do their best with it. The Commissioners themselves would, he feared, experience a considerable amount of difficulty in working the Act and they could be assured of their deepest sympathy in their task. He was utterly sick of the 1926 Act, and had had quite enough of it; they hoped that they should soon see the end of the difficulties that now seemed to be looming ahead.

The Mayor of Bedford, Ald. G. H. Barford, J.P., gave "The Buxton Corporation," and thanked the Mayor and Corporation and all the people for what they had done to make the Conference one of the most successful they had ever had.

The Mayor of Buxton (Councillor W. Goodwin) responded.

Alderman W. Walker proposed the toast of the "Ladies and Guests" in felicitous terms, and suggested that the ladies might create for them a fashion in the use of electricity.

Lady Brooks, C.B.E., J.P., in responding, said that what they wanted in the electrical world was vision: electricity and intelligence could not be separated.

During the dinner the Gardens orchestra, under the direction of Mr. Sydney Freedman, rendered selections of music.

The I.M.E.A. Exhibition.

(*Concluded from page* 948.)

On the stand of the General Electric Co., Ltd., a full range of "Magnet" household appliances included the vacuum cleaner, washing machine, wash boiler, and the refrigerator. Special attention was given to the "Magnet" electric cooker, which showed the latest developments in the company's enclosed hotplates. We understand the G.E.C. has developed a hotplate which is claimed to be fool-proof, quick boiling, very robust, and at the same time has a high efficiency and high insulation resistance, both when hot and cold. Street lighting appliances were also shown, including the "Wembley" lantern in various designs. A special attraction was a large ornamental "Wembley" for promenade and main-street lighting.

Messrs. Kelvinator, Ltd., displayed three domestic models of the Kelvinator refrigerator, and also a Kelvinator Nizer compressor, which is designed particularly for use with large installations for butchers, hotels, and so on.

A comprehensive range of electrical cooking apparatus was shown on the stand of the Hotpoint Electric Appliance Co., Ltd. Of special interest was the new Hotpoint cooker, model 6281, fig. 9. It is fitted with a double-door oven, which can be sub-divided into two small ovens, and an efficient grill with a plate-warming chamber. A feature was an electrically heated frypan; it is constructed of cast-iron and fitted with side-handles for lifting. A heat-regulating switch is mounted underneath. The loading is 2,000 watts. An electric wash-boiler, 9-gal. capacity, was also included in this exhibit. The body is constructed of cast-iron, and black glass-enamelled inside. A standard 3-kW, 3-heat immersion heater is provided.

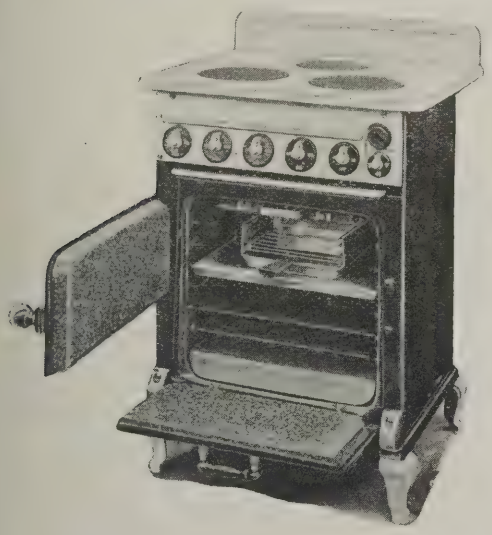

Fig. 9.—Hotpofnt Double-door Cooker.

A revised model of the No. 5280 Hotpoint-Falco standard electric cooker was also shown. It has a grey porcelain enamelled hob which carries two "Sadia" boiling plates, 1,800 W each, and a 3-heat grill, 1,500 W. The oven is loaded at 2,000 W. The chief innovation is the fall-down oven door, which is of the usual standard size. The oven lining is fitted with wire runners instead of the usual angle-iron or pressed metal, thus making for greater cleanliness. The grill chamber is fitted with a drop-down door.

The display by Messrs. Sadia, Ltd., included "Sadia" automatic thermo-storage water heaters with capacities of from 2 to 44 gal. A full range of fast boiling plates, including the new 4½-in. circular single-heat plate, was also shown. The latter was also seen mounted as a table stove. A new mercury-break thermostat for a very fine control of air and water temperature was demonstrated, and also automatic time and temperature control switches.

Some improvements to the Bastian storage geyser were seen on the stand of the makers, Messrs. Bastian Meter Co., Ltd. A new model has a white enamel finish, a new method of fitting the terminals, and a capacity of 15 gal. The exhibit also included electric fires embodying the Bastian Quartzalite heating element. The latest Bastian fires are the "Super Imp," 2 kW, the super "Imp de Luxe," 2 kW, the "Black Baby Imp," 1 kW, and the "Sunshine Baby Imp" in brass and copper, 1 kW. These are very attractive models, and so designed that the parts are easily accessible for cleaning.

In accordance with the wishes of the I.M.E.A. Council, Messrs. J. H. Tucker & Co., Ltd., kept their display as simple as possible and confined it to a demonstration of the load-breaking abilities of Tucker tumbler switches of the B.4,000 type. A s.p. 5-A switch that can deal with 33 A at 250 V, and 5 A (its normal rated current) at 525 V d.c., was shown breaking a load of 15 A at 250 V, while a s.p. 15-A switch carried 60 A at 250 V, and 15 A at 550 V d.c. Moulded switch-plates of a new design were shown, eliminating the loose ring, and providing improved insulation, and the "Kwik-wire" terminals, reducing erection costs, were demonstrated.

A variety of apparatus exhibited by Messrs. Archibald Low and Sons, Ltd., included a 75-gal. electric thermo-storage tank; this is of copper, white enamelled, and fitted with two 2-kW heaters controlled by the thermostat, and one 2-kW booster heater, fitted near top of tank, controlled by an ordinary switch. This tank is being fitted in an all-electric house in Edinburgh for heating during the off-peak load. A 10-gal. "Highlow" electric hot-water tank, No. 312, which was shown, has a loading of 750 W, and is designed for fitting over a bath. For use over a basin is a 2-gal. "Highlow" tank, No. 345. This was also exhibited; it has a loading of 500 W. The "Highlow" Parker-Smith cooker was also seen on this stand, as also were immersion heaters and electric oil heaters.

Among a variety of ingenious devices seen on the stand of Messrs. Venner Time Switches, Ltd., was an electrically wound time switch. The winding element consists of a tiny motor of unusual design. A small armature is balanced between two electro-magnets and vibrates with the frequency of the system. By means of an attachment at its centre, it revolves the rotor, the latter embodying a specially designed "free-wheel" clutch. The operation is silent. The makers guarantee the accuracy of the switch to within half an hour per year. It is interchangeable as regards dimensions with the makers' 45-day clock. Another feature of the exhibit was a Venner prepayment attachment, fitted to a Sangamo meter, which is designed to prevent the accuracy of the meter being affected by a varying number of coins being inserted. The "winding stress" is removed from the recording gearing by means of a specially designed fly device. The attachment connects with the ordinary train gear of the meter by the simple engagement of two toothed wheels. By means of a number of price units, each of which completes the train of gearing in the attachment, the reduction can be varied to suit any price per kWh from ¼d. to 1s.

Fig. 10.—Venner Silver Grill.

The Venner silver grill, fig. 10, was another item of interest. It consists essentially of two portions, the top or food-containing receptacle, and the bottom, soldered together at the rims. A space between the two portions is partially filled with oil, which is just in contact with the bottom of the pan. The heating elements are contained in the oil, in direct contact with it, so that the heat is transmitted very rapidly to the pan. The cooking surface is of a special black finish, "Russian iron," which, it is claimed, prevents the taste from any one food being transferred to another. The loading is 600 W. A non-return filling valve is fitted for the oil.

The Venner-Shotter water meter was also to be seen. An invention of Mr. G. F. Shotter, of the North Metropolitan Electric Power Supply Co., it is designed to measure the height or flow of water over weirs or notches. The action depends on the electrical conductivity of solutions, and, in use, the liquid to be measured is used as the electrolyte. Two conducting paths are provided by the solution, one in which the dimensions vary with the depth or flow of the solution, and the other in which the dimensions are constant. By measuring the ratio between the currents that flow in the two paths, a function of the depth or flow of the liquid is obtained.

Messrs. Venner also showed photographs of a new system of pneumatic control, for valves on pulverised-fuel plant and steam mains, which they have developed. The control is claimed to be positive in action and to give a visible indication at any desired point when the operation is completed.

Messrs. Siemens & English Electric Lamp Co., Ltd., showed a selection of Siemens-Xcel electric cookers in various sizes. These embody a new totally-enclosed high-efficiency boiling plate which the makers have developed. A few safety kettles, incorporating a cut-out device to prevent damage if the kettle is boiled dry, were also exhibited. A feature of the display was a new type of cast-iron boiling ring, incorporating the standard cooker boiling-plate element. Other exhibits included a new design of bathroom fire, a new type of bowl fire, and immersion heaters in various sizes and loadings.

The "Electra" lawn mower (Electrical Review, April 15th, 1927, p. 615, in two models, 16- and 20-in. cutting widths, was exhibited by Messrs. Ransomes, Sims & Jefferies, Ltd.

A selection of electric heaters developed since the last I.M.E.A. convention at Glasgow was on view on the stand of Messrs. Young, Osmond & Young, Ltd. The internal construction of the Unity tubular heater has been greatly improved, and the sample shown at Glasgow has been adopted as the standard. The use of porcelain as a support for the element has been abandoned, and a longitudinal mica strip used instead. There is, therefore, the minimum internal mass of material to be heated, and the tube itself begins to warm up rapidly as soon as current is switched on. Although the tube is not lined by insulating material it is impossible to make contact with the tube even in the event of the element breaking, since the distance between the supports is less than the radius of the tube. As the element is designed to work at a black heat, the current density has to be low and the cross sectional area correspondingly large; the chance of a broken element is therefore very small.

In addition to examples of the usual straight tubular heater, some curved tubes were shown. These are suitable for

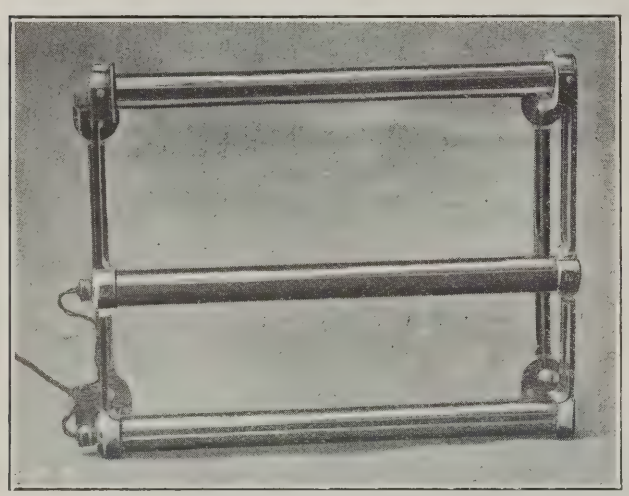

Fig. 11.—Electric Towel Rail.

installation under the curved seats of theatres and kinemas. Electric towel rails, fig. 11, in which the tubular heaters are incorporated, were shown. A feature of interest was a new terminal box for use with double rows of tubes. This ensures correct alignment and simplifies wiring. Other exhibits included tubular radiators and a selection of standard watertight and gas-tight heaters developed for the heating of buildings in which explosive vapours are present.

Among the manufactures of Carron Company on view were electric cookers, fires, irons, wash boilers, and so on. The cookers included model No. 310 F, a feature of which is its porcelain enamelled door and sides. The total loading of the cooker is 6,750 W. A similar type, but for larger households, No. 311, was also shown. Besides a larger oven, this model has three boiling plates. It can also be supplied with porcelain enamelled sides. The total loading is 8,200 W. In another range which was on view, No. 313, the oven and grill are mounted on legs at a convenient working height; it should appeal to those interested in the table form of cooking appliance. In the selection of the electric fires was the company's latest design, No. 271. This is 14 in. wide by 23 in. high, has a loading of 2 kW and is highly finished.

A range of water-heating apparatus was a feature of the display of Messrs. George Nobbs, Ltd. A variety of "Genii" appliances included: "Vectis" local storage-type water heaters with capacities of from 5 to 30 gal. and loadings from 100 W upwards; "Push-system" water heaters suitable for bulkhead or wall fixing, with capacities of from 1¼ to 15 gal. and loadings of 50 W upwards; "Safety" geysers with interlocked switches and water valves, loadings 3 to 40 kW; "National" calorifiers for serving a number of hot-water draw-offs from one central point, suitable for bulk storage by night; and blade-type immersion heaters. A range of water distillers suitable for use in battery-charging stations was also shown. A feature of the stand was a range of central-heating batteries for the hot-air warming of buildings. These have steel housings and loadings varying from 1 to 500 kW.

The "Boby" air-cooled automatic refrigerator shown by Messrs. Robert Boby, Ltd., is claimed to be the first of its kind to be manufactured by a British firm. It is intended for domestic use, and is made up in two styles in cabinets constructed of compressed cork slab insulation. The small electric refrigerator machine is contained in the base of the cabinet, and is completely automatic. The cabinet is at present made in four different sizes—10, 15, 20, and 30 cu. ft.

Messrs. Berry's Electric, Ltd., introduced for the first time some very beautiful designs of "Magicoal" fires in which was incorporated the new "living flame" effect. The first model of this was recently supplied for the Duke and Duchess of York's new residence. Another new exhibit was a radiant heater of the reflector type with a novel heating element. In the 3-kW size of this there are three separate windings on one central rod, which can be switched on one at a time. Each winding is carried from end to end of the bar, so that the heat is distributed over the whole length of the reflector, no matter how many sections are turned on at a time.

The McClary cooker was also shown. We understand that the works which are being erected for the manufacture of this cooker are nearing completion. The McClary cooker is enamelled inside and out. The oven is fitted with removable elements, racks, and so on, making the whole of the interior perfectly plain for easy cleaning.

The "Savage" electric washing machine was another Berry exhibit. This wringerless machine will, it is claimed, do the four operations of clothes washing—washing, blueing, rinsing, and drying—without removing the "wash" from the tub in which it was originally placed.

A feature of particular interest on the stand of the British Thomson-Houston Co., Ltd., was a new type of motor which embodied many valuable improvements in design. Two of these machines, one a.c. and one d.c., were of the same rated output and had identical essential dimensions, a feature of great importance to builders of machines intended for different supply systems. The motors will run at any angle and can be supplied with simple enclosing covers to give any desired form of protection. An interesting point in connection with the rotor of the squirrel-cage type of motor is that there are no joints in the cage. The aluminium bars and end-rings are cast in one piece by a patented centrifugal process which ensures uniformity of texture and eliminates the tendency to fracture.

A range of "Inventum" apparatus attracted a good deal of attention on the stand of Messrs. Drake & Gorham, Ltd. One exhibited article, the "Domestic" cistern, is particularly recommended for use where small quantities of water are required at frequent intervals. A gallon and a half of water at 195 deg. F. is available about 1½ hours after switching on. It has a loading of 500 W, and is complete with a 3-pin plug and safety socket. It is thermostat controlled. An unusual

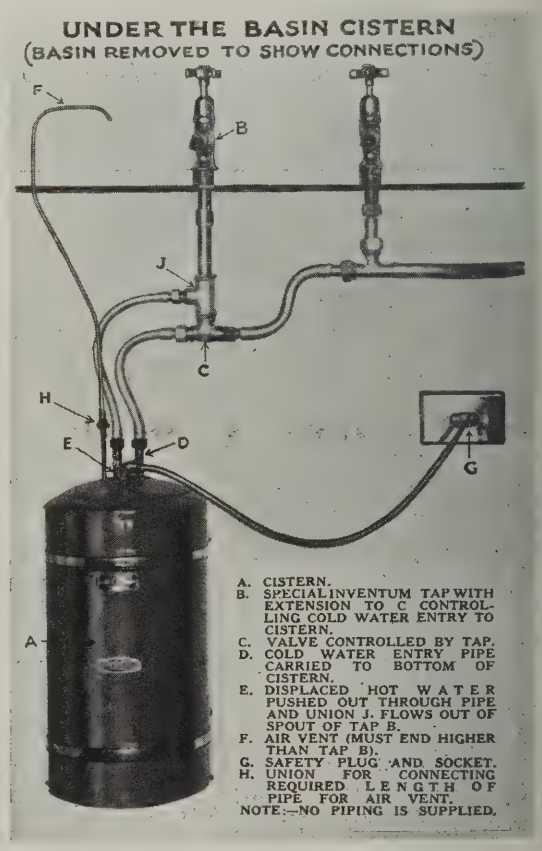

Fig. 12.—New "Inventum" Cistern.

exhibit was the "Under the Basin" cistern. This has been developed to meet the situation in cases where space shortage does not permit the use of the "Domestic" model. Fig. 12 shows the working arrangement of the apparatus. The special tap, which is fixed on the basin, controls the inlet of cold water into the cistern, and the hot water displaced flows out of the same tap. The capacity and loading of the apparatus are 1½ gal. and 500 W, respectively. It is supplied with a 3-pin plug and socket. The "Bath" 500-W cistern was also shown. This is intended for the small household where one or two baths are taken each day. It is provided with brackets at the back for wall fixing.

A variety of electric heating, cooking, and water-heating apparatus was to be seen at the display by Messrs. Belling and Co. The electric cookers, vertical and horizontal, included some specially designed for hiring purposes. These are equipped with enclosed-type boiling plates, plug-in elements, and an enamelled hob. A number of new designs of electric fires, industrial and domestic, were also part of

the exhibit. A sectional view of a fire, showing the details of construction, attracted attention. Other apparatus exhibited included immersion heaters in actual use, and some new models of electric boiling plates and grillers. An efficient switch and interlocking plug-socket was shown.

MESSRS. L. G. HAWKINS & COMPANY, LTD., had a fairly comprehensive display of electric domestic apparatus, including cookers, washers, cleaners, ironers, percolators, and toasters. The "Electrolux" products, the cleaner and refrigerator, were on view at the stand of MESSRS. ELECTROLUX, LTD., who also had an enormous automobile model of the cleaner on view near the Opera House.

A wide range of electric domestic apparatus was exhibited by the BRITISH ELECTRIC TRANSFORMER CO., LTD. Included in the cookers was a new model, No. 722, which is designed to meet the requirements of 12 persons. It has a higher oven than its predecessor, No. 669, 18 in. instead of 14 in. Three boiling rings are fitted, as previously. The interior of the oven is in a removable-box form with a "dished" back and all-rounded corners. In all cases except the small model, No. 703, the Tricity cookers now have fuses and reciprocating switches in compartments under the hob.

A standard wash boiler seen on this stand has an element of the clamped type, a special method of stud reinforcement being a leading feature. The loading is 3.5 kW. The tap is at a suitable height from the ground, whilst its position in the container is such as to ensure all the water not being drawn off without the boiler being tipped forward.

A feature was a new breakfast cooker, shown for the first time. Of cast-iron throughout, this is a very strong appliance. Several designs of Sun Ray radiators were also shown.

The ELECTRICAL ASSOCIATION FOR WOMEN was represented by a stand with a collection of literature and particulars of the constitution and objects of the Association.

The Electricity Department of the Corporation of Buxton (Mr. A. Bishop, engineer and manager) had a stand setting forth the conditions of supply and a new tariff which is being introduced in the borough, including hire-purchase terms.

A striking exhibit was that prepared by the Electric Lamp Manufacturing Association, comprising features which were shown for the first time. We reproduce a photograph of one of these—a model engineering workshop, fig. 13, made by Messrs. Partridge's Models, Ltd., complete with miniature machine tools, hand tools, benches, &c., and equipped with two systems of lighting with tiny lamps, to

Fig. 13.—An E.L.M.A. Model Workshop.

show the difference between good and bad illumination practice. Other models for the same purpose represented a draper's shop-window and a business office.

Mr. GEORGE WILKINSON, M.I.E.E., in conjunction with Messrs. MEASUREMENT, LTD., had an interesting display of his patent "Losles" electric thermostats and water heaters, in operation, one set piece consisting of a fan and a radiator alternately cooling and heating a thermostat which alternately switched on one and the other in the vain hope of attaining a stable condition. The "Losles" thermostat has been greatly improved in design and construction since it was first introduced; experience has shown the weak points, which have been eliminated, the present pattern being very substantial and the regulation close; it is made in sizes from 5 to 30 A, and for voltages up to 500 V. One of the exhibits was a water heater of novel design; it consisted of a heating element immersed in oil in a copper tube, to be fixed at the bottom of a water tank. The oil forms the medium conveying the heat to the water surrounding the tube, and the variation of its volume with temperature serves to actuate a mercury switch controlling the circuit.

Messrs. BERRY'S ELECTRIC, LTD., in addition to their exhibit, opened a special showroom in the town, where an exact copy of the Duchess of York's fireplace was shown, as well as some score other patterns of the "Magicoal" fire, the McClary cooker, and other domestic apparatus. A centre of attraction after dark was a window arranged by E.L.M.A. to show a statuette with a background of drapery, illuminated from several concealed sources with ever-changing combinations of coloured light.

Messrs. W. T. HENLEY'S TELEGRAPH WORKS CO.'s travelling demonstration van, which we illustrated last year, was at Buxton, and was open for inspection.

A Large Electric Clock.

The tower clock at the new Canadian Houses of Parliament, Ottawa, is to be electrically operated, and will control the hour and quarter striking on the 53-bell carillon.

OF particular interest in connection with the new Canadian Houses of Parliament which are to be opened at Ottawa this year, is the electrically-operated clock with which the tower is being equipped. It is being installed by Messrs. Gillett & Johnston, Ltd., who are also supplying the large carillon of 53 bells in conjunction with which the electric clock will work.

The clock has four dials of bronze, glazed with white opal glass, each 15 ft. 9 in. in diameter. The hands are of copper, to the architect's design, while the motionwork is of the firm's standard construction. The motionwork wheels and also the nests of bevel wheels are constructed on the bed-plate

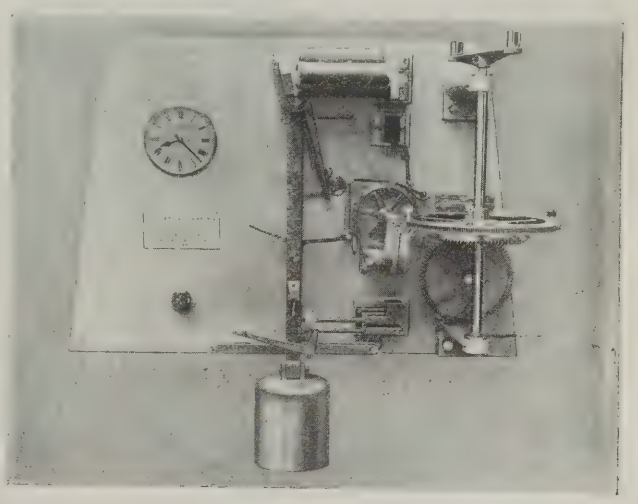

Fig. 1.—Clock Movement.

and plummer-block system, which gives great rigidity and accessibility for oiling and cleaning. The universal joints and connecting rods are all of unusually large scantlings, minimising the torque and back-lash, while still allowing for perfect freedom of action.

The timepiece portion of the clock movement, fig. 1, is of the Hipp type in its most modern and improved form. The motive power for the pendulum is obtained from accumulators used in the Parliament Buildings for other purposes. The current energises two very-large-capacity magnets which apply the driving power to the heavy pendulum with a smooth and silent action. When the arc of the pendulum falls to a predetermined amount, due to the work being done in turning

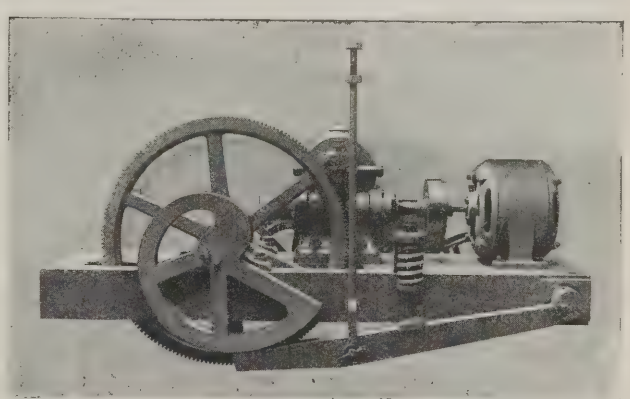

Fig. 2.—Striking Mechanism.

the hands, a wiper toggles in a steel notch and completes the circuit through the magnets, the impulse so given to the pendulum rapidly bringing this back to its maximum working arc. As a pendulum doing so much work cannot possibly keep accurate time, it is arranged that the hands reach each half-minute about 2 seconds in advance of the actual time, and that they are released by the impulse of the master-clock circuit exactly at each half-minute. An indicating dial in circuit with the master clock is incorporated in the design of the timepiece movement. All the parts are placed on the machined front surface of a deeply ribbed, vertical casting, and are well arranged for easy access. This timepiece is placed on a concrete base on the floor of the dial chamber in a glazed case.

The striking and quarter mechanism is fixed at a suitable lower level in the tower, beneath the heaviest bells. The striking gear consists of a cast-iron bed-plate on which is mounted a 1½-h.p. electric motor supplied from the 550-V.

2-phase, 60-cycle power mains. A single cam is driven by means of worm-wheel and spur reduction gear, and lifts the 560-lb. hammer (see fig. 2). Special automatic switchgear of a very simple and durable type is fitted for starting and stopping the motor, which is accomplished on the warning system by the closing and opening of a contact on the timepiece. The contact starts the motor, and a count wheel attached to the striking gear opens the switch for stopping the motor.

The Westminster quarter gear, fig. 3, is identical in action with the striking gear as far as the motor worm-gear and switch-gearing are concerned. Heavy steel cams operate the

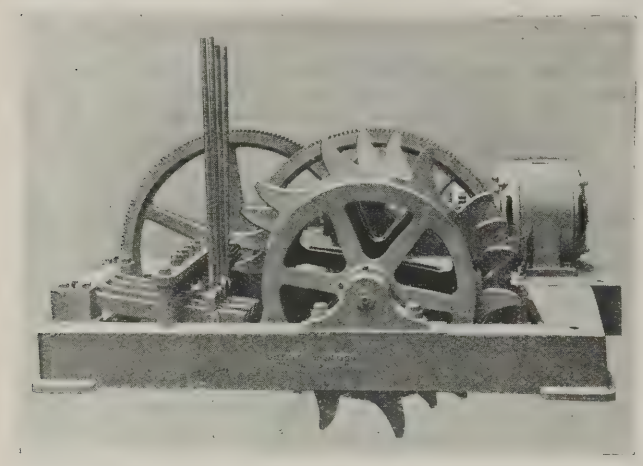

Fig. 3.—Quarter Mechanism.

forged quarter levers. The motor drive not only eliminates the manual labour of winding exceptionally heavy weights, but as the speed of the motor is constant and it has a large excess of power beyond what is actually required, the timing of the blows is claimed to be exceptionally crisp and accurate, although unusually heavy hammers of necessarily varying weights are in action.

The true Westminster quarters are played and the hours are struck on the bourdon bell of the carillon, which weighs 10 tons.

Indian Electrical Imports.

Figures for 1925-26 and 1926-27 Compared.

(FROM OUR INDIAN CORRESPONDENT.)

THE following are details of the imports of electrical machinery and apparatus into India during the year 1926-27, compared with the previous year 1925-26, notes of increases or decreases being added :—

	1926-27. Rs. lakhs.	1925-26. Rs. lakhs.	Inc. or dec. Rs. lakhs.
Electrical machinery of all kinds—			
Total	228	222	+6
Control and switchgear	32	36	−4

Indian Duties on Battery Chargers.

By a recent ruling of the Indian Central Board of Revenue, battery chargers imported into India will be classed as machinery (subject to a 2½ per cent. duty) if they embody rotary convertors requiring more than 0.25 b.h.p., otherwise they are subject to a duty of 15 per cent. Battery chargers which employ transformers cannot be classed as machinery, and are subject to a 15 per cent. duty as "implements, instruments, &c."

New Electrical Devices, Fittings and Plant.

Readers are invited to submit particulars of new or improved devices and apparatus for publication in this Section.

Motor-Operated Rheostats.

A recent introduction of Messrs. Ernest F. Moy, Ltd., Greenland Place, Camden Town, London, N.W.1, is a range of motor-operated rheostats specially designed for use in connection with remotely controlled switchgear. Fig. 1 shows a typical example of this equipment. This has a load capacity of 470-160 A, and a resistance of 1.1 ohms. The apparatus is constructed about an angle-steel frame on a cast-iron base, the sides and back being protected by perforated sheet-steel. The motor is housed in the base and drives the sliding brush vertically over the resistance contacts, by means of a square-thread screw and nut, through a totally enclosed worm gear. Limit switches are fixed at each end of the brush path, which stop the motor and leave it ready to restart in the opposite direction as soon as the control switch is reversed. The switches replace themselves automatically when the brush moves away from the end position. The resistance is in the form of nickel-copper wire clamped direct to substantial arms which form the switch contacts, so that no intermediate connections are used. The arms are carried on heavy slate bars mica-insulated from the frame. The apparatus can be made for any working capacity and voltage.

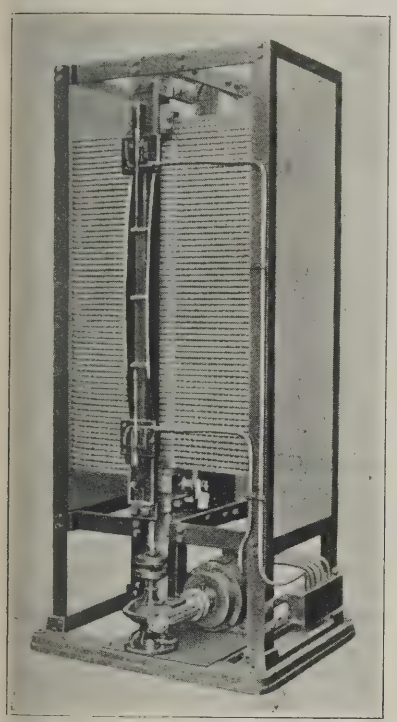

Fig. 1.—A Motor-Controlled Rheostat.

Lead Headed Nails.

We have received from Mr. T. F. Snow, 247, Shakespeare Road, Loughborough Junction, S.E.24, some samples of lead-headed nails which he is producing, and which are claimed to be particularly useful in connection with the fixing of cables of electrical, telephone, and wireless installations. The new nails differ from the old type in that the tops of the heads are not covered, so as to avoid the hammer making contact with the lead and loosening it. The nails are made in six sizes, from 1 in. to 3 in. for wall fixings, and in two sizes, 1 in. and 1¼ in., for use on woodwork. The fixing tags vary from ⅝ in. to 1¼ in. in length.

The Empson Emulsifier.

The seasonal variation in supply and demand, the vagaries of the weather, and the prohibition of the use of food preservatives have hitherto militated against the general use of cream in restaurants, bakeries, and private households. Fortunately, however, a new method of dealing with the problem of cream supply has come to the fore, which consists in emulsifying the ingredients of natural cream, when and as required, by dissolving dried powdered milk in water, adding unsalted butter, heating the liquid in order to melt the fat, and then passing the mixture through an emulsifier, whence it issues in a condition ready for use. By this process cream of any desired thickness can be produced by simply varying the proportions of the ingredients; moreover, the cream can be "whipped" immediately it leaves the machine, without cooling on ice, and will keep for two or three days longer than natural cream. The complete apparatus, fig. 2, consists of a mixing tank fitted with an electric heater of from 1 to 4 kW, according to size, and a patented pump of special form, the whole being collapsible for cleaning purposes. The pump is provided with a screw propeller and guide vanes, and it lifts the solution from the bottom of the tank and discharges it over the surface, thus entraining the fat which tends to float; the device is more effective, and consumes less driving power, than the ordinary paddle stirrer, and it delivers the mixture to the emulsifier at a constant rate of flow and in constant proportion throughout the run, thus obviating hand regulation as the level of the liquid falls in the tank; its capacity is about 900 gallons per hour. The emulsifier consists of a disk-like high-speed rotating drum, made in three pieces and held together by a single nut, designed to produce violent turbulence, the liquid being forced to flow outwards through a series of "whirlpools" which cause intimate mixing. This vortex action constitutes the principal novelty of design, and is the subject of the main patent held by Capt. A. W. Empson, 26, Bridge Road, Taylor's Lane, Willesden, London, N.W.10.

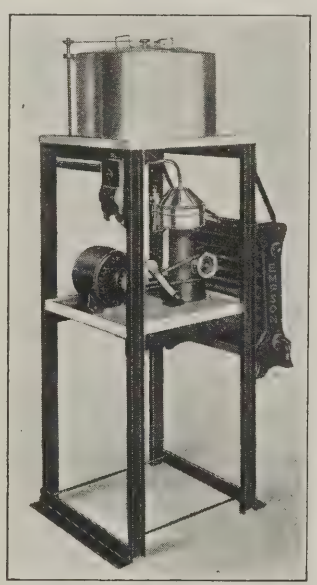

Fig. 2.—The Empson Emulsifier.

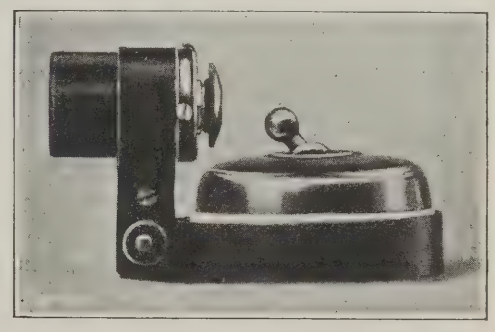

Fig. 3.—Switch Timing Attachment.

Actually the liquid passes through four vortices in series, involving seven abrupt changes of direction before the emulsion is discharged into the collecting chamber surrounding the drum, whence it flows over a cooler through which tap water is circulated. The E B-type emulsifier illustrated herewith, which should have many more applications than that mentioned above, will make from 1 to 5 gallons of thick cream at a time, and has a capacity of up to 20 gallons per hour; it is driven by an electric motor of only ½ h.p., which also drives the pump mixer in the tank. The base of the machine measures 20 in. by 24 in., and its overall height is 62 in.

An Automatic Switch-Timing Attachment.

An attachment for use with an ordinary tumbler switch, to allow switching-off to be done automatically after periods of from a few seconds to 15 minutes from the time of setting, has been placed on the market by Messrs. F. A. Wilkinson and Partners, Ltd., Gretton, near Kettering, Northamptonshire. It should prove useful in those cases where double-switching arrangements do not exist. Fig. 3 shows the device in position; it is not electrical and is merely clamped round the base of the switch. The device is operated by means of air pressure on a suitable piston. Operation of the latter throws the switch handle over at the correct moment.

The air is compressed by pushing the piston backwards till it is locked by a convenient catch. The release of the catch puts the piston and plunger in action. The time setting is effected by turning the knurled knob at the end of the plunger, a release valve being opened to an extent depending on the turn of the knob.

A Small Electric Cleaner.

An advertisement in *Electrical Merchandising* depicts a small electric vacuum cleaner, the "Presto-Junior," which is being marketed by the Metal Specialities Manufacturing Co., 338-350, North Dedzie Avenue, Chicago. It appears to be so arranged that the whole apparatus, driving unit, dust chamber, and accessories, is carried and operated by one hand, after the style of the whisk broom. This should prove particularly useful for cleaning staircases, &c. It is claimed that the appliance is capable of doing the work usually allotted to machines of the larger size.

Short-Wave Wireless Telegraphy.

A Novel Theory of the Skip Distance which agrees closely with the Observed Results.

By T. L. ECKERSLEY.

(*Review of a Paper read before the* WIRELESS SECTION *of the* INSTITUTION OF ELECTRICAL ENGINEERS.)

THE paper deals with the state of short-wave practice and theory, and describes experiments made in order to elucidate transmission phenomena, and certain theoretical developments based on the investigations. It involves a breakaway from the traditional views of simple ray refraction, which reflects the essential divergence of the ideas presented from those previously published; the diverse systems in use indicate how far we are from finality in this matter. The ray theory, developed from the original work of Eccles and Larmor, has been pursued to the bitter end in this country, but is by no means universally accepted; Dr. Meissner, in particular, has developed another theory based on experimental transmission to Buenos Aires. In the author's opinion the ray theory as developed by Americans (Taylor and Hulbert, Heising, Shelleng and Southworth, Baker and Rice) neglected the very important factor of the absorption of energy in the ray, and he attempts to show that this theory plays a dominant part in practically all transmissions. His experiments should throw light on the nature of transmission as well as on the practical design of suitable aerials for short-wave working. Theory and practice are inextricably involved in this latter question: for instance, it has been proposed to use aerials which radiate their energy upwards in order to take advantage of the reflection from the Heaviside layer; Marconi's Co. favours the beam radiating more or less horizontally, with a vertically polarised wave, while Alexanderson in America appears to regard the horizontally-polarised wave as being the more favourable for transmission, and uses a horizontal doublet for the purpose. It is therefore of considerable practical importance to decide whether the vertical or horizontal rays are the more effective, but in previous attempts to calculate polar diagrams the problem has always been simplified by assuming that the earth is a perfect conductor, which may lead to very considerable errors, because the corrections due to the imperfect conductivity of the earth include terms which involve the product of the frequency and resistivity, and therefore become significant in the short-wave range. In the first section of the paper the author therefore takes into account the finite conductivity of the earth and calculates the approximate polar diagram for the case of a vertical doublet situated at a height above the surface of the earth. An immediate consequence of his theory is that the aerial radiates practically nothing horizontally (except in the immediate neighbourhood of the transmitter), for when the earth is not perfectly conducting, the absorption of the rays propagated horizontally is so great that all the lower rays are more or less completely absorbed, which is a radical departure from preconceived ideas. It is shown that the intensity of low-angle transmission is increased by raising the transmitting aerial; but, on the contrary, for high-angle transmission, a half-wave aerial situated near the earth's surface is practically as good as any other.

In order to make practical use of this we require a knowledge of the best angle of elevation for transmission over any required range. In the next section of the paper an account is given of direction-finder experiments designed with a view to the determination of the nature of transmission on short waves; in particular the angle of incidence of the incoming (and therefore by the reciprocal theorem the outgoing) rays is studied, the conclusion being reached that in long-distance transmission the ray traiectory has a shallow angle of elevation, 15 deg., and follows the great-circle path.

The third section of the paper contains the results of a series of long-distance transmission tests; waves between 25 and 10 m. were used, and experiments were made which indicated the superiority of a raised doublet over one at the ground level.

In the last section the general theory of ionic refraction is discussed in the light of these and other experimental results. The effect of attenuation due to the collision of electrons with molecules is especially stressed, and a novel theory of the skip distance is put forward which has the merit of agreeing closely with observed results.

The ray theory has been successfully used to explain and compute the "skip distance," the evidence for the existence of which effect has been largely accumulated by Hoyt Taylor in America. It seems to be an undoubted fact that in the neighbourhood of a short-wave transmitter, signals drop in intensity very rapidly with distance, may disappear entirely at distances of 100 or 200 miles, and then begin to increase again to a maximum and finally die away at very great distances. The distance skipped in this way appears to depend on the wave-length, season, and local time. It increases with increasing frequency, is greater at night than in the day, and in winter than in summer. The suggestion is, of course, that the greater the frequency is, the less the bending and the further off the main target of the rays.

If we consider the sheaf of rays sent out by the transmitter, the lower-angle rays find their target at a great distance; as the angle is raised the target point approaches to some minimum value d_1 corresponding to some angle θ_1, and as the ray angle is still further increased the target point recedes again until at $\theta = \theta_0$ the ray escapes from the earth altogether. By making certain assumptions with regard to the heights of the refracting layers and the distribution of density in them, chiefly chosen, it appears, from the point of view of mathematical convenience, that good agreement between the calculated and observed values of d_1 has been obtained; but when it comes to comparing observed and calculated *intensities* the picture presented by the calculation seems to the author to be very wide of the mark. One consequence of the ray theory that is significant is that, apart from the direct ray, absolutely nothing should be obtained within the "skip distance," and that there is practically a discontinuity at the skip distance. In actual fact conditions are nothing like this. Heising, Shelleng and Southworth have made simultaneous measurements at various distances from short-wave stations working on 66 and 44 m. and, beyond a slight dip at regions of about 150 miles, there is no sign of a complete disappearance and sudden commencement of signals beyond the skip distance; in their measurements there is only an increase of about 10 to 1, which may possibly be exceptional. If we take the change in strength at AGB (at Nauen), for instance, during the late afternoon and evenings, as an indication of a transition into the region within the skip distance, as night falls the roughly measured intensity change may be as much as 1,000 or 10,000 to 1; but whatever amount the ratio of intensity of the signals within and without the skip distance may be, the form of the intensity diagonal distance curve seems to be a smooth curve, and there is every indication of high-angle reflected or scattered energy within the skip distance, contrary to the ray theory. The author feels that he will be guilty of suggesting the heresy that the escaping ray theory of the skip distance is by no means proved, and suggesting an entirely different alternative theory.

The only evidence we have is that within the skip distance the indirect rays (reflected or refracted) are either not present (complete skip), or are present with very diminished intensity. We know that the high-angle rays do not get back to earth, but this does not prove that they escape—they may be absorbed in the upper regions of the atmosphere; if this is the case the estimates of the minimum wave-length (for long-distance transmission) based on a supposed maximum density, are absurd. In order to compare them with Heising, Shelleng and Southworth's actual measured values of the density in the region of the "skip" distance, the results of the author's computations are reproduced (in the original paper) in the form of curves in which intensity is plotted against distance. The general form of the two are similar, but the calculated intensities at 300 miles and over are in general too great; if we assume that there is a lower fringe to the layer, slightly ionised and reaching down to levels of 15 to 20 km., there will be added attenuation practically proportional to the range which will be responsible for the major portion of the long-distance attenuation and which will tend to better the agreement between the observed and calculated characteristics. Similar arguments apply to night transmission, where there is the additional evidence of a low-density fringe in which the "squeak X's" are produced. The author's view of the two layers is this: a lower daylight layer is situated in regions between 50 and 70 km. from the earth, in which the density increases so rapidly with level that there is very little penetration (for long-distance glancing-angle incidence), with a lower fringe (of small electronic density) in which the main long-distance attenuation, which must be present, occurs. The path of the ray through the lower fringe (over long distances) will, in general, be more or less independent of the wave-length, so that attenuation will be characterised by a falling off in proportion to the square of the frequency, as has actually been found in the short-wave range. Similar considerations apply at night time, with added complications due to the rotation of the plane of polarisation as the ray travels along the earth's magnetic field, and of the double refraction effects due to the same cause.

This theory seems to the author to be capable of dealing with, and explaining, a very much wider range of facts than the simple ray theory; in particular it links long- and short-wave transmission in a perfectly reasonable way, and accounts for the contrast in long- and short-wave daytime transmission characteristics, in respect of seasonal and magnetic disturb-

ance effects. It naturally explains the increase of range with frequency (short-wave day transmission) and requires a plausible constitution of the upper layers in agreement with the evidence from other sources (in particular diurnal magnetic variations) and leaves no important fact unexplained.

It seems to be an undoubted fact that there is a short-wave limit below which it is impossible to get long-distance transmission. It seems probable that the limit for night transmission is in the neighbourhood of 17 m., although the echo effect seems to show that under certain conditions waves as short as 14 or 15 m. may get through 20,000 km. of darkness.

In daytime the short-wave limit does not seem to have been reached at 10 m. A recent experiment on 8 m. (using the same transmitter and power as in the other short-wave experiments) seems to indicate that this is below the limit, as nothing was received in Sydney, Montreal, New York or South Africa, so that the limit appears to lie between 8 and 10 m. This short-wave limit has received a very natural explanation on the ray theory, *i.e.*, it is supposed that the density in the upper layer is not sufficient to bend even the horizontally-transmitted rays back to earth, so that all the rays escape. The author is not inclined to accept this explanation, chiefly on the ground that there is evidence of high-angle rays, within the skip distance, of even the shorter waves (20 to 25 metres), which on the ray theory should be entirely absent; or we may put it in another way: observations within the skip distances suggest very strongly that the layer is rich enough in electrons to bend even the high-angle rays back to earth, but, of course, with much diminished intensity.

In the calculations for the skip distance the attenuation in the main layer for small angles of elevation, and for a sufficiently long wave-length (some 40 m.) (apart from the lower fringe) was found to be so small as to be negligible (actually the attenuation should have been greater, on account of the increased ray length in the layer occasioned by the earth's curvature) because at these glancing angles (and for sufficiently long wave-lengths) the penetration and ray path in the main layer is so small as to introduce but little attenuation; but, as the wave-length is reduced, the penetration and ray length in this layer rapidly increase and will reach a stage at which attenuation begins to be important, so that for sufficiently short waves the rays will be able to penetrate this layer and not get out again even at glancing incidence.

The picture that the author has of transmission on different wave-lengths is this: For waves above the limiting wave-length this attenuation constant is small, and long-distance glancing-incidence transmission takes place in the space between this main layer and the earth. Penetration into the main layer is small, and the whole attenuation is small and caused by the sparsely populated fringe below the layer, but directly the wave-length is made shorter than this short-wave limit, and the main ray penetrates well into the main layer, absorption sets in and further long-distance transmission is impossible. This theory applies to both day and night transmission with suitable values for τ in each case. This is essentially a modified form of layer theory.

Correspondence.

Correspondents should forward their communications **as early as possible.** *No letter can be published unless we have the writer's name and address in our possession.*

A Radio-Telephone Loud-Speaker.

I have read with considerable interest the article on this subject by Mr. E. W. Braendle, A.M.I.E.E., in the current issue of the Review. Since it appears that Mr. Braendle claims to disclose the construction of a speaker which will give very good reproduction, sufficiently good, in fact, to do justice to the quality of the B.B.C. transmission, I venture to suggest that on his own showing his speaker does not fulfil these conditions, and I think many readers would be glad to learn his justification for various statements.

First of all, "mobility" and "rigidity" of cone diaphragms are mentioned: I should like very much to learn what is indicated by these two terms, and in what way they are desirable or undesirable features of a diaphragm. Next, Mr. Braendle makes not the slightest reference to the drive and its influence upon the diaphragm, and the correlation of the two. The type of drive employed cannot possibly energise the diaphragm so as to give an even response over a useful frequency band. Space does not permit me to explain why this is so, but readers who are unfamiliar with such matters can refer to the subject in a standard text-book.

Perhaps the most amazing point in Mr. Braendle's article is the curve, fig. 6, showing, apparently, the impedance of the windings of the speaker at various frequencies. In the first place, let it be most emphatically stated that the most useful form of loud-speaker curve is one showing audio response plotted against frequency. Another extraordinary point is that this curve is taken only across a very small frequency band, *i.e.*, frequencies from about middle C to about 2½ octaves above middle C, that is, roughly, 250 to 1,500 cycles. Over this very small compass the impedance of the windings varies from 8,000 to 35,000 ohms; but, as previously mentioned, this type of curve indicates very little of the performance of the speaker. If, then, Mr. Braendle intends us to infer that the usefulness of his speaker is represented by these graphs, we may assume that it gives substantially no bass. So far as the treble is concerned, the curve still seems to be rising; therefore it is not possible to infer what happens.

My own experience of commercial loud-speakers leads me to believe, when comparing them with that of Mr. Braendle, that his speaker falls far short of some of the best cone balanced-movement-driven speakers. I happen to have a very accurate response curve showing loss or gain in T.U. in the response of a well-known commercial cone, which reproduces fairly evenly over a band extending from approximately 50 to 5,000 cycles. In the case of a coil-driven speaker the response is substantially perfect, and on one laboratory model frequencies as low as 25 cycles can easily be reproduced. This means, of course, that the speaker can reproduce the lowest organ notes, whereas on many types, and, I would suggest, the one under consideration, they would be entirely absent. Perhaps Mr. Braendle would be good enough to explain the various points which I have raised.

Paul D. Tyers.

Watford, *June 6th*, 1927.

Single-phase Induction Motor Starting Devices.

The remarks of Mr. W. S. Daniels in his discussion of my recent article on the above subject are rather difficult to understand.

If Mr. Daniels reads through the article carefully he will find no claim that the Ferraris-Arno method of working is a new one, and therefore the historical information given in his letter is rather superfluous. In fact, I should expect that anyone possessing any knowledge of the system at all would fully appreciate the fact that it was developed during the early times of motor development.

My object in writing about the Ferraris-Arno system is fully set out at the commencement of the article, which was intended for the average engineer not possessing, or interested in, the information relating to patents given by Mr. Daniels, and I can therefore only conclude by thanking Mr. Daniels for bringing to my notice Hobart's "Electric Motors," which I had overlooked at the time of writing the article.

G. Windred.

London, *June 11th*, 1927.

A Commutation Problem.

Please allow me to thank Messrs. H. Joseph and P. Oaks for their views on the above problem. Regarding Mr. Joseph's suggestion of the trouble being mechanical, it is not so, as the commutators were certainly faultless in this respect, and I feel confident that the responsibility lay on the electrical design.

In explanation of my suggestion that the conductors were 7½ degrees out of place, I may be wrong, but the following is my reasoning: there are 12 slots and 24 commutator bars; in each half-slot (top or bottom) there are 2 coil sides, A and B, taped together. If the brushes be set so that the A wires are exactly right for commutation, the B wires, which, according to their commutator bars, should be 360/24=15 degrees ahead, or behind, are to that extent wrong, as their average position is the same as the A conductor, being mixed up, or "mushed," with them.

The idea was that in practice the brushes would be adjusted so that instead of A being right and B 15 degrees out, each would be 7½ degrees each way, and this is the best obtainable.

Briefly, even if by subdividing the coils as above, the reactance is sufficiently reduced so as to obviate sparking from that cause, there is a lower limit to the number of slots, due to the above reasons.

A. D. Griffiths.

Caergwrle, *June 10th*, 1927.

The Ideal Wiring System.

My attention has been called to a letter on page 910 and to an editorial note thereon. The suggestion is that a lead-covered cable in contact with perfectly dry plaster can be corroded by the plaster. I think it may be stated with absolute certainty that no chemical action could take place under such circumstances.

With regard to the last lines of your editorial note, I do not think any cable maker would subscribe to the statement that it is well known that lead sheathing should not be laid in contact with plaster. Practically all lead-covered surface wiring systems are in contact with plaster, and corrosion is practically unknown; notwithstanding the statement that the lead-covered cable in question was perfectly bonded, all investigations so far have shown that chemical action between lead and plaster is due to electrical leakage and points to imperfect bonding.

L. B. Atkinson.
The Cable Makers' Association.

London, *June 10th*, 1927.

Power Supply for Wireless Sets.

I read with interest the article by "G. F. J.," on his experiences with eliminators for a.c. mains, and I wondered if any of your readers had tried ordinary "power" valves for this purpose, using them with the grid and plate joined. I have an eliminator using a "Stentor Four" valve and the output is:—11 mA. at 220 V, 18 mA. at 180 V, and 30 mA. at 120 V, these figures being obtained with the filament run at only 3 volts. I think this is as good a performance as those mentioned by your contributor; it could no doubt be improved on by running the filament at its normal 4 volts, or by using valves of the "super power" class.

Metal-clad Draw-out Switchgear.

The article by Mr. T. Carter on the above subject in your issue of May 27th, far from being a comparison of the horizontal and vertical types, appears actually to be a eulogium in one definite cause, the supporters of which might have become restive due to the ramifications of the manufacturers of the vertical units. Certainly any intelligent engineer, if he had the patience to read the whole of the article, would lay it aside with the conviction that Mr. Carter had failed in the object for which he set out, that is, to have us all believe that the horizontal draw-out type of unit is the embodiment of everything that is perfect.

If, as I believe to be the case, Mr. Carter resides in the Newcastle district, he will undoubtedly have had abundant opportunities of thoroughly examining that type of switchgear which he prefers, and having, so to speak, been brought up in its neighbourhood, one can understand his preference.

The first portion of his closing paragraph reads as follows:—

"If I have succeeded in expressing myself as I have wanted to do, I will have made it clear that the balance of advantage lies with the horizontal type *for small and moderately large units.*"

This, in my opinion, amounts to a complete refutation of the advantages which Mr. Carter is careful to assign to the horizontal type of unit, as clearly the question of suspended weight, accessibility, and compactness in the case of the vertical type, is of far less moment in relation to small and moderately large units, than with the very large sizes.

Mr. Carter may be certain of one thing, namely, that where the makers of the vertical type claim weatherproofness, capability to deal with short circuits, and any other attribute which is inherent in that particular design, they will have taken great care to ensure that their claim is a sound one, and not merely made regardless of truth.

The best answer to Mr. Carter's apparent condemnation of the vertical type of unit is the enormous number of these units which are being continually manufactured.

There are occasions when horizontal gear is preferred to vertical gear, and *vice versa*; why not let it rest at that without "trumpeting" one type to the detriment of the other?

Reviews.

The Practical Telephone Handbook. Seventh edition. Joseph Poole, A.M.I.E.E., Wh.Sch., and others. Pp. xxv + 870; figs. 637. London: Sir Isaac Pitman & Sons, Ltd. Price 18s. net.

The fact that this handbook, which is really a compilation of the work of a number of writers, has reached its seventh edition shows that it has not lost in popularity as time goes on. One of the earliest of manuals devoted exclusively to telephone matters, it has maintained its place as a student's text book on that subject for many years, practically unchallenged. The present edition is a revision of the previous one, which has been increased by the addition of 146 pages and over 100 illustrations. Several of the chapters have also been wholly rewritten. The fact that the author and his coadjutors are on the staff of the British Post Office may be taken as a sufficient guarantee of their ability to provide the reader with reliable descriptions of the standard practice which has been adopted in this country. There are, in all, thirty-seven chapters dealing successively with batteries, receivers, transmitters, sub-station apparatus and instrument connections, intercommunication, switchboard apparatus, relay and lamp signalling, P.B. exchanges, magneto exchanges, common battery systems, junction line working, trunk and party line working, power plant, aerial and underground construction, loaded lines, multiplex telephony, submarine telephone cables, testing, telephonic repeaters, wireless telephony, automatic exchanges, and traffic and development studies; from which it will be seen that the writers have covered a somewhat extensive field within the scope of one volume.

In the chapter dealing with secondary batteries the old chemical formula for discharge is still retained, no mention being made of Fèry's equations representing the actions of charge and discharge which it is usual to give as an alternative, if not a more correct, explanation of what takes place. It would also be interesting to know how the empirical formula for the ampere-hour capacity of a cell is arrived at.

The chapter on receivers and transmitters is well up to date. In the latter class a brief but suitable description is given of the 2 L.O. broadcasting transmitter.

Additional matter has been added to the previous work on exchange working, particularly in the case of junction and trunk line developments. This was rendered necessary by the interposition of automatic with manual exchanges.

Chapter XXXII on telephone repeaters, although necessarily restricted to a general outline of the methods employed, will, nevertheless, give the reader an accurate knowledge of this recent and important branch of telephony.

It is stated that there are large numbers of trunk circuits up to 200 miles in length which consist of two-wire repeater circuits working on 20 lb. and 40 lb. conductors, instead of 100 lbs. upwards to 800 lbs. per mile as in the case of aerial trunks not furnished with repeaters. This is economy indeed.

The chapter on wireless telephony gives a fairly adequate account of the methods and progress in this field. The theory of the action of the two-electrode and triode valves is given, and also an explanation of the method of heterodyne reception. The transmitting arrangements at Daventry broadcasting station are described and a simplified diagram of the circuits is appended.

Automatic telephony occupies over 100 pages of the book and is probably the most important feature of the work.

Descriptions are given of the various systems now in operation, including the "Director" system, which has been adopted for the London district, and a number of excellent inset diagrams are given. It is observed, however, that fig. 647 is missing and has not been inserted between pages 772 and 773 as stated on page 769.

The book closes with a chapter on miscellaneous applications, including a description of the structure and operation of the modern loud speaker, and a series of useful tables is given in an appendix.

As a practical handbook on the subject of telephony the book justifies its recommendation as a suitable text-book for the City and Guilds of London Examination in that subject.

Electrical Condensers. By Philip R. Coursey, B.Sc., F.Inst.P., M.I.E.E. Pp. xxiv+637; figs. 514. London: Sir Isaac Pitman & Sons, Ltd. 1927. Price 37s. 6d. net.

The author of this book draws attention in the preface to the remarkable development which has taken place in the use of condensers during recent years, both in the sphere of radio communication and also in that of heavy electrical engineering. The extensive field of application of the electrical condenser renders a work of the kind under review very opportune. The author has treated his subject on a very broad basis, the matters dealt with ranging from the theory of the dielectric circuit, to details of manufacture of condensers for industrial purposes.

The opening chapter deals with the fundamental properties of the condenser and with its behaviour on both d.c. and a.c. circuits. After a historical survey of the development of the condenser, the author proceeds to deal in detail with the properties of dielectrics, with the measurement of these, and with the important subject of dielectric losses. A chapter is devoted to the calculation of the capacities of condensers of various types from their geometrical properties. As the author generally starts from basic principles in his theoretical investigations, we think that the derivation of the constant for the conversion of capacities from electrostatic to electromagnetic units might have been given. The subject of this chapter is continued to the calculation of the capacity of overhead lines, aerials, and underground cables. The reference to the latter is very slight, and the difficulties attendant upon the use of insulated cables, at pressures above 22 kV, are merely the subject of a passing notice. A lengthy chapter of a descriptive nature deals with the use of condensers for radio work, this being followed by a detailed treatment of the design of condensers of this description. A good chapter follows on the measurement of capacity, in which the theory of the various methods available is fully worked out, and the practical details of the several tests are adequately set out. In the chapter on variable condensers for radio work the author discusses very fully the problem of the design of condensers in which the capacity is a required function of the displacement of the movable member. A number of descriptive chapters follow, in which the details and manufacture of condensers with air, glass, paper, mica, and liquid dielectrics are very fully dealt with. The use of condensers for protection against over-pressures in high-tension transmission systems is described, and there is a brief chapter dealing with the use of condensers for the correction of power factor in industrial a.c. supply circuits. This last chapter is little more than a brief sketch of the subject, and in a work of this character might with advantage have been considerably amplified. The reference to the synchronous condenser is rather misleading. The function of this machine for power factor correction is so different from that of the static condenser, and its property of having the wattless current supplied under easy, or even automatic, control is so valuable that a comparison of the two types is hardly possible. A remarkable feature of the work is the lengthy

bibliography, extending to no fewer than 100 pages, and containing over two thousand references.

Mr. Coursey's book will, perhaps, be of greater interest to those concerned with radio work than to power engineers; the bias, as would be expected from the professional connections of the author, tending decidedly in the direction of the former field. As a work of general reference it will be of considerable value to all engineers, but we fear that the scope of its appeal will be somewhat restricted by its high price.

Notes on Electricity as Applied to 1926 Artillery. Pp. vii+254; figs. 86. London: H.M. Stationery Office, 1927. Price 2s. net.

This little work is intended as a handbook of instruction relating to the various apparatus used in the Artillery Service, and it is prefaced by an account, in simple, non-mathematical language, of elementary electrical theory. The first part of this theoretical section deals with the effects of electricity, and with the simple properties of electrical circuits. In the effort to compress a wide subject into a restricted compass, conciseness is sometimes obtained at the expense of clearness. The last sentence on p. 39 is ambiguous in that it appears to imply that a direct current cannot be produced by electromagnetic induction; whilst the explanation of virtual values of alternating quantities given in the footnote on p. 40 is far from happy. The customary term, impedance, is preferable to "apparent resistance" for the quotient of volts by amperes in an alternating-current circuit, and this latter expression is better used for the quantity, volts²/watts, which in a circuit embracing an iron core, is different from the actual resistance as measured by direct-current methods. Part 2 deals very satisfactorily with the construction and principles of operation of simple direct-current instruments, with the measurement of resistance, the theory and use of the potentiometer, and with the use of the detector for simple testing. Part 3 deals simply with primary and secondary batteries, wiring, telephones, and electrical machinery. In the diagram, on page 75, of the method of charging an accumulator from the supply mains, the battery is shown connected in the positive main of a two-wire system. A note should have been made of the desirability of inserting the battery in the earthed pole when the direct-current supply is obtained from a three-wire system.

The last section of the book deals with the details of actual Service apparatus, and sets out full directions for its use. The very full accounts of various telephone equipments will be found of considerable use, and a lengthy description of the Fullerphone is included in this section. The book concludes with a number of questions involving simple arithmetical work; references are made to the several paragraphs in the book which these questions are intended to illustrate; and the answers to the questions are given. It seems rather a pity that the latest suggestion of a capital "omega" as a symbol for "ohms" is not used, instead of the obsolete and inconvenient "O."

Although we have had occasion to offer a few criticisms on relatively minor matters relating to this book, we are pleased to say that it has been very well and skilfully written to meet the needs of those approaching the study of electrical matters for the first time. We think that the book will be found very useful to elementary technical students, wiremen, and telephone linesmen and maintenance men who require a simple account of the rudiments of electrical theory, instruments, measurements, and signalling apparatus.

Television. By A. DINSDALE, A.M.I.R.E. Pp. 62; illustrated. London: Sir Isaac Pitman & Sons, Ltd. Price 2s. net.

In this little book the author outlines the history of "television," which he defines as "vision by telegraphy"—certainly not a sound or appropriate expression, as in television there is no permanent record of the images transmitted. He explains the nature of the problem to be solved, and briefly describes the earlier attempts to overcome the great difficulties that were met with, leading up to the Baird "Televisor," which is dealt with as fully as circumstances permit. The treatment of the subject is highly optimistic, the author being an enthusiastic admirer of Mr. Baird's achievements, which he regards as successful, though he admits that "at present the transmitter has not emerged from the laboratory"; progress is "continuing at a rapid rate," and we hope that eventually the inventor's dreams will be fully realised.

Published Specifications.

Compiled expressly for this journal by a firm of Chartered Patent Agents. The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

ABERCRAVE.—Houses (200), for the Welsh Anthracite Collieries, Ltd.

ALTRINCHAM (CHESHIRE).—Housing scheme (40), for the U.D.C.; surveyor.

ASHFORD (KENT).—Additional 60 houses, for the U.D.C.; E. Clark & Sons, builders, Melton Mowbray.

AYLESBURY.—Conversion of the Old Manor House into home for mental defectives, for Bucks. C.C.; county architect.

AYRSHIRE.—Shops, hall, and temple for Lodge Troon Navigation, Troon (£4,000); J. R. Johnstone, architect, Troon.

BARLBY.—Factory, foreshore of River Ouse; Yorkshire Sugar Co.

BISHOP AUCKLAND.—Electric washing plant at Maternity Home; Durham County medical officer.

BLACKBURN.—Additional 96 houses, Brownhill, for the T.C.; borough engineer.

BRISTOL.—Crematorium, for the T.C.; H. G. Malcolm Laing, Lincoln's Inn, architect; Alfred Dowling & Son, contractors, 125, North Road, Bishopston.

BULFORD.—School, for Wilts E.C.; director of education, Trowbridge.

CALNE.—School, for Wilts. E.C.; director of education, Trowbridge.

CARLYLE.—Housing scheme (100), with electrical work, for Lanarkshire C.C.; P. C. Smith, District Offices, Hamilton.

CHELTENHAM.—Proposed medical baths at Winter Garden; borough engineer.

CHERTSEY.—Additional 50 houses, for the U.D.C.; Mr. Parker, architect.

CHESTER.—Public offices, Northgate Street, for the T.C.; Charles Greenwood, city engineer.

CHESTERFIELD.—Extensions, Furnace Hill Works; Morgan Crossley & Co., Ltd. Extensions, Portland Works; Robinson & Son, Ltd.

CHIPPING NORTON.—Boys' secondary school, for Oxfordshire E.C.; director of education, Oxford.

COLCHESTER.—Housing scheme (70), for the T.C.; borough surveyor.

CONGLETON (CHESHIRE).—Extensions, Brown Street Mill (£15,000), for W. A. Lowe & Co.

DEWSBURY.—Additional housing scheme (200), for the T.C.; borough surveyor.

DORKING.—Secondary school, for Surrey E.C.; W. W. Finny, secretary, Kingston-on-Thames.

DOUGLAS (ISLE OF MAN).—Electro-medical pavilion, Noble's Isle of Man Hospital; J. E. Teare, architect, 46, Athol Street.

DUMBARTONSHIRE.—School at Kirkintilloch (£11,000); clerk, Education Authority, Dumbarton.

DUNDEE.—Shops for Eastern Co-operative Society, Ltd.; the manager.

ECCLES.—Additional 78 houses, for the T.C.; borough surveyor.

EDINBURGH.—Conversion of Calton Prison into headquarters of Scottish Command; officer commanding. 570 houses at Prestonfield for Corporation; city architect.

EPSOM.—Re-organisation of institution laundry, with electrical work (£6,502), for the B.G.; the clerk.

FELIXSTOWE.—Bandstand, enclosure and dancing kiosk (£13,000), for the U.D.C.; surveyor.

FENTON.—Oil depot and offices, Argyle Street; Shell-Mex, Ltd.

FIFE.—Extensions at Adamson Cottage Hospital, Cupar; the medical superintendent.

GLASGOW.—Picture house at Carntyne; Messrs. Rosslyn Mitchell & Tullis Cochran, writers, agents. 250 steel houses, Clydebank; Atholl Steel Houses, Ltd.

HALESOWEN.—Conversion of Cornbow House into council chamber and municipal offices, for the U.D.C.; surveyor.

HASTINGS.—Orthopædic and isolation departments, Royal East Sussex Hospital; Percy H. Oxley, architect, 29, Havelock Road.

HEMSWORTH.—Cinema and dance hall; W. P. Peters, architect, 125, Vicar Lane.

HEYSHAM.—Congregational Church, Sefton Road; Messrs. Baines, architects, Morecambe.

HULL.—Installation of electric lighting, Boulevard secondary school; Education Committee.

IRISH FREE STATE (TRANMORE, Co. WATERFORD).—Waterworks scheme, including pump and filtration plant for the County Board of Health; J. F. Delaney, 97, Stephen's Green, Dublin.

KERESLEY.—Cinema, Bennett's Lane, for F. Voce.

KINGSTON-ON-THAMES.—Y.M.C.A. headquarters, Eden Street (£6,000); J. P. Blake, architect.

LONDON (FINCHLEY, N.).—40 houses, Leslie Road and Church Lane; W. Hollis, Junr.

(WOOLWICH, S.E.).—Houses (360), for the T.C.; John Laing and Son, Ltd., builders.

(STREATHAM, S.W.).—School (£18,762), Streatham Vale, for London E.C.; F. & T. Thorne, builders, Isle of Dogs.

LYMINGTON (HANTS.).—Infirmary, for the B.G.; John Bevir, architect, St. Thomas Street.

MITCHAM.—Wilson cottage hospital (£25,000); Chart, Son and Reading, architects.

MOTHERWELL.—Extensions to county hospital, with two new pavilions, operating theatre, &c., for Lanarkshire C.C.; the clerk, Glasgow.

NORTHALLERTON.—Factory extensions, for the Linoleum Manufacturing Co.

NORTHAMPTON.—Grand stand, offices, &c., Weedon Road; Northampton Football Club. Works extension, Fetter Street; Phipps & Son.

OSSETT.—Alterations, Station Road; Yorkshire Penny Bank, Ltd. Housing scheme, Swithenbank Estate; borough engineer.

OXTED.—Secondary school, for Surrey E.C.; W. W. Finny, secretary, Kingston-on-Thames.

PLYMOUTH.—Development, Whitleagh Estate, Higher St. Budeaux; A. Searle & Son. Development, Barne Estate, St. Budeaux; Body & Son. Premises, Mutley Plain; Plymouth Savings Bank. Café and shops, Keyham Road; C. R. Emmett. Foundry, Dartmouth Road, Birmingham Aluminium Casting Co., Ltd. Works, Beakes Road; World's Wear, Ltd. Smallpox hospital, Sparwell; borough engineer.

PURLEY.—Fire station and firemen's houses (£9,351), for the U.D.C.; C. H. Gibson, Ltd., builders, Croydon.

ROCHDALE.—'Bus garage, Mellor Street, housing scheme (188), Castleton Estate; S. H. Morgan, borough surveyor, Town Hall.

ROTHERHAM.—Engineers' workshops, Thames Street and Mary Street; Duncan White (Engineers), Ltd. Electric light installation, Thornhill School; Education Committee. 'Bus garage, tramways depot (£9,950), for the T.C.; borough engineer.

ROWLEY REGIS.—Houses (146), for the U.D.C.; J. Harper and Sons, builders, Blackheath, near Birmingham (78), and Butler Bros., builders, Erdington (68).

RUABON.—Cinema, New High Street, for the Cambrian Border Cinemas Co., Ltd.

RUSHDEN (NORTHANTS.).—Church, for the Wesleyan trustees; secretary.

ST. ALBANS.—Council offices, for the R.D.C.; Mance & Ross, architects, 32, St. Peter's Street.

SMETHWICK.—96 houses by direct labour, Manor Road; borough engineer.

TILBURY.—Church (£4,000), for the Wesleyan trustees; C. M. Shiner, architect, Grays.

TONBRIDGE.—Housing scheme (40), for the U.D.C.; surveyor.

TORQUAY.—Stores at refuse destructor for Corporation; R. Wilkins & Sons, Ltd.

TUNSTALL.—Oil depot and garages, Scotia Road; Anglo-American Oil Co., Ltd.

UDDINGSTON.—Housing scheme (172), with electric lighting, for Lanarkshire C.C.; P. C. Smith, District Offices, Hamilton.

WELLINGTON (SALOP).—Re-erection of saw mill premises, for Groom & Sons (several thousand pounds).

WEST YORKS.—School, at Bramley and Wickersley; Education Department, County Hall, Wakefield.

WHITCHURCH (SALOP).—Housing scheme (42), for the U.D.C.; surveyor.

YORK.—Extensions, tram depôt, Piccadilly; tramway manager.

The Electrical Review

VOL. C. JUNE 24, 1927. No. 2,587.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

Our Hundredth Volume.

WITH this issue the hundredth volume of the ELECTRICAL REVIEW is completed; it is an event of some significance, bearing silent testimony to the age of an industry which, however, as industries go, is still in its youth, with the prospect before it of unbounded prosperity when it is in its prime. Nearly five years ago we celebrated the fiftieth anniversary of the birth of this journal; the reason why the two dates do not coincide is that during its early years only one volume was completed each twelvemonth.

Starting on November 15th, 1872, as "The Telegraphic Journal," on January 15th, 1873, it added the sub-title "and Electrical Review." Turning over the old volumes, it is interesting to observe that the former title gradually shrank whilst the latter was printed in larger and larger type, until in 1882, when for the tenth volume the present format was adopted, the telegraphic title became subsidiary, and in 1892 it disappeared completely. That gradual change was symbolic of the great transformation that was taking place in electrical engineering—the growth of a new and vastly greater branch from the parent stem, the extension of the electrical field into all departments of civilised existence.

Yet our first issue was not wholly devoted to telegraphic subjects; pure science was also represented, a new thermo-pile was described having "an intensity equal to that of 60 Daniell elements," and an automatic arc lamp was illustrated. "City Notes," then as now, dealt with finance and industry, noting the opening for traffic on October 21st of the British Australian Company's cable which afforded direct communication between London and Melbourne. This year, in our hundredth volume, we have recorded the opening of a channel of communication between those cities without the use of a cable—the beam wireless system, which is a no less meritorious achievement than the former.

An outline of the history of the ELECTRICAL REVIEW was given in the Jubilee number of November 17th, 1922, but the keynote of that issue was "Looking For-

ward." Continuing in that vein, it would be interesting to speculate upon the appearance and contents of the 200th volume; when that appears, we fancy, the all-electric age will have arrived. Dr. Ferranti's dream of electricity at ½d. per unit will have been realised, our railways—if transport still goes by land—will be electric, and the "grid" will not only have been completed but superseded by directional radiation of electric power.

The I.E.E. Wiring Rules.

The new (ninth) edition of the I.E.E. Regulations, just issued, takes the place of the edition which was published in 1924 and subsequently amended by leaflets. It is stated that it contains some alterations which had become urgent, but as no one can cheerfully face the task of comparing the two volumes line by line, we venture to express regret that no indication of the places where changes have been made appears in the text. Had this been provided, men who were familiar with the text of the Eighth Edition (if they existed, outside the ranks of the Wiring Regulations Committee) could easily have brought their information up to date.

The fact that a Tenth Edition was on the stocks has been more or less widely known; it is now officially announced, together with the glad news that it will take a simpler form than that which is now current. To expect a wireman to be *au fait* with a book containing 128 Regulations and 14 tables is to ask too much of any man; it defeats its own object. The Home Office plan of issuing a comparatively short set of Regulations and supplementing it with an explanatory memorandum is much better. In the I.E.E. code the attempt has been made to deal with every case that is met with in electrical installation work, instead of stating broad principles, laying down a few definite and essential requirements, and relegating long-winded definitions, explanations, and alternatives to an appendix or a separate memorandum.

Anyone who turns over the pages of the book must recognise at once its resemblance in some respects to an engineering specification, although its use as such is expressly deprecated, or to a text-book, which again is declared to be no part of its purpose; moreover, it possesses some of the characteristics of an Act of Parliament. There is far too much verbiage, and too little is left to common sense. It may be argued that common sense is scarce; our reply is that a man without common sense will take little heed of rules, long or short. We should like to know how many installations carried out since 1924 comply strictly with the regulations. Does any?

Engineering Finance, Economics and Organisation.

The speeches delivered last week at the luncheon of the British Engineers' Association were commendably brief and businesslike. Mr. H. J. Ward, the president, with a few appropriate sentences, introduced the principal speakers —Mr. Reginald McKenna, the head of our largest Bank, and Sir Arthur Balfour, chairman of the Committee on Industry and Trade. Each of these gentlemen knew exactly what he was going to say and how to say it.

The Association passed a resolution early in the year asking that an inquiry should be held into the theoretic basis and practical technique of our credit and currency system, including the Bank of England as the central institution and custodian of our monetary resources. Mr. McKenna felt that the resolution was a wise one and should have been acted upon by the Government without delay, but the Chancellor of the Exchequer thought differently, or to be precise, he was not aware of any sufficient grounds to justify such an inquiry, which, he said, would have an unsettling effect in many directions. Mr. McKenna's speech was a reply to the Chancellor. He showed what had been happening along the same lines in many other countries which were not afraid of an "unsettling effect," and added that it would not be very difficult to give sufficient reasons why we should hold such an inquiry. None of the countries which had reformed their financial institutions had copied the Bank of England, but they had adopted some system similar to the Federal Reserve Act of the United States. This surely suggested that there was something for us to inquire into. We had no generally accepted body of opinion in this country; an inquiry would help us to form such, and on the basis of a well-informed public opinion we could establish the finest system in the world.

The speech of Sir Arthur Balfour, who stands high in the industrial world, as Mr. McKenna does in that of finance, was devoted to the International Economic Conference at Geneva from which he had just returned. He paid a tribute to Mr. Bremner, the Director of the British Engineers' Association, for the service he had rendered by preparing for the Conference the "finest document on engineering ever produced in this country," a document which was the admiration of the representatives of all the fifty nations represented at Geneva. Among the conclusions reached at Geneva was one that cartels and industrial agreements could only be applied to relatively few industries, namely, those where the article produced was similar and comparable in different countries. It was proved to be a fallacy that tariffs could be reduced by means of cartels; sometimes the reverse occurred. The Conference held that tariffs were too high, too complicated, and too often changed. It was obvious that new productive plant was being put up, though the world already had more than was needed. Subsidies were a curse; the more trade and commerce were left to people who understood them and were left alone by Governments and politicians, the more business we were likely to do. Sir Arthur asked what steps were to be taken to bring the recommendations of the Conference home to the people. Such bodies as that Association should play a part in such a direction. All trades in this country should be organised as they were. In future we should have to spend a great deal more money upon our trade organisations if we wished to compete with foreign countries. More brains from the industries themselves—especially from the younger men—must be brought to bear upon Trade Association matters; such organisations should not be run by "officials." Some kind of International Association was needed and younger men should acquaint themselves with the subject of international negotiations. Sir Arthur made the familiar but still painfully true remark, that hard work and better organisation were what were needed to bring the world right —fancy schemes must be abandoned. If we wished to defeat Sovietism we must organise as quickly as possible to develop the stream of better trade which was indicated by last year's return—and give employment to our people; we must work together better, each striving in his own works to reduce grievances—the food upon which Sovietism throve.

Mr. Bremner, the closing speaker, referred to the difficulties of the engineering industry, adding that the work contributed by individual firms in support of his Association was so small as to be a grave reflection. It was deplorable that they should find it necessary to augment their subscription income by means of revenue derived from extraneous sources such as an engineering directory and British Empire Exhibition profits. He appealed to the industry to find the money and the other necessary support for maintaining efficient trade organisations.

The Contractors' Convention.

The Electrical Contractors' Association is making excellent progress. Its membership has passed the thousand mark, and in many directions members are feeling the benefits of the Association's added strength. The papers presented at the second annual Convention of the E.C.A. Allied Associations at Scarborough this week were of a high order and were full of interest not only to the contractors to whom

they were addressed, but to supply authorities and other members of the electrical industry.

Next week we shall deal with some of these papers, but here we may say briefly what each was about. Mr. Grierson, in "Some Interesting Points in Connection with Modern Installation Work," stressed the need of the contractor for less stringent conditions; the present ones, if those quoted are indeed fair samples, certainly bear hardly upon members of the trade. Care was counselled in fixing costs of quantities and time of an indefinite nature. Mr. Grierson's text was "Union is Strength," and he said that a "hundred per cent." membership of the E.C.A. would lead to a vast improvement in the conditions under which electrical installation work is carried out.

Mr. J. Kirkham's paper aims at showing how narrow a margin separates success from failure in the electrical contracting industry, and stresses the need for proper costing—as distinct from mere accounting. Methods of dealing with the many items not relating to particular jobs are outlined, and not only contractors will find the paper worthy of study. In his concluding address the new president, Mr. W. A. Shaw, expresses the necessity for more contractors' showrooms, and Mr. H. F. Walker deals with this matter in his paper to-day on "The Electrical Showroom as a Commercial Proposition and its Relation to the Industry." It must be said, however, that the author places first in his list of factors essential to progress the reduction of the cost of electricity to an absolute minimum. The electrical education of the public comes second, and harmony within the industry third. He agrees with the maintenance of permanent displays by municipal supply authorities, but says that these should not be employed for the discouragement of private enterprise; their object should be purely educational—for the sale of more energy. Mr. Walker submits that the contractors are the people to set up the showrooms which will be necessitated by the development of the industry, and deals in detail with the organisation and arrangement of such showrooms.

The Growth of the B.I.F.

WHEN discussing the future of the British Industries Fair in our issue of April 1st (p. 502) we advocated as one way of overcoming the difficulty of expansion at the London end the transfer of certain classes of exhibits, including those of electrical and allied classes, to Birmingham, where there is abundant site space available. We are not familiar yet with the nature of the new arrangements, but it would seem that the difficulty referred to has been negotiated satisfactorily, from the official standpoint at all events, for we learn that for the Fair which is to be held from February 20th to March 2nd, 1928, the exhibition area in London will exceed the space provided there last time by 100,000 square feet. At Castle Bromwich, Birmingham, extensions of 80,000 square feet are to be made. We are informed that the space already applied for in the Birmingham section amounts to double that taken by the corresponding time last year. We are glad to note this, but not in the least surprised, for the enterprise shown by the Birmingham Chamber of Commerce has been one of the outstanding features of the development of the Fair during the last few years. It is certain that unless the Chamber, through its electrical members, had taken up our particular branch of the trade two years ago, there would have been little left by way of electrical exhibits. The assistance that it has been our privilege to render in connection with its progress has been given because of our firm conviction that the electrical and allied trades should fill an increasingly important place in the Fair. An exhibition held under Government auspices to impress buyers with the character, variety and extent of British products must, of course, contain a strong representation of British electrical manufactures. Yet we do well to remember that, however important we may regard it, the electrical is but one out of a host of sections, and innumerable considerations have to be borne in mind in settling matters of general policy.

Any doubt that has been expressed regarding a possible abandonment of the Fair, under the Government economy plans affecting the Department of Overseas Trade, is set at rest by the official intimation that the Government has leased the White City for the London Section for the necessary periods in 1928, 1929, and 1930. Application forms have been sent out to approximately 10,000 British manufacturers regarding this Section, and no doubt the Birmingham authorities will soon be proceeding energetically with their electrical and other activities. Their space application forms have already been circulated. What they asked last February was that different branches of industry should guarantee certain support for a period of years. With three Fairs assured, perhaps this may be a reasonable basis upon which electrical exhibitors can discuss various matters, including maybe the question of date which some seem to think should be reconsidered.

Preserving the Amenities.

WRITING to the *Morning Post*, the Countess Bathurst expresses apprehension lest one effect of the national scheme of electricity supply be to string unsightly overhead mains on hideous steel masts across Britain's beauty spots, as, she says, has happened in Switzerland and Italy. Prof. J. A. Fleming, in reply, points out that the alternative of underground cables which the Countess advocates is not practicable at 135,000 volts, but he puts forward the interesting suggestion that all lattice towers, outdoor switchgear, and transformer stations should be painted green or brown, or whatever colour best matches the prevailing tint of the landscape. In Switzerland, he says, this practice is being adopted, and certainly it appears to be commendable, even though it affords only a partial remedy for the complaint. Dr. Fleming adds that in England little or no attention is being paid to this question; lovely districts have been recklessly disfigured in Wales, but in Switzerland care is taken to place power stations and lines as far as possible from such places.

Now is the time—before the "grid" has begun to take shape—to impress this important consideration on the minds of the responsible authorities. The national interconnecting mains must inevitably be overhead, but something can be done to mitigate their ugliness; how obtrusive overhead construction can be the Post Office has shown us with its lines of 50 or 100 conductors running across the country.

Our Service Department.

JUDGING by the diffidence with which inquiries are sometimes addressed to us, it would appear that some of our readers are not yet aware of the existence or, at any rate, of the functions of our Service Department. That branch of our activities, as its name implies, was developed for the express purpose of affording information on any subject within our province to any reader who is in need of it; we receive some thousands of inquiries every year, and are happy to be able to satisfy by far the most of them. All answers are sent by letter, as soon as possible, provided that a stamped addressed envelope is enclosed with the inquiry. Occasionally we have to appeal to readers for the solution to a poser, and we are grateful to the many correspondents who have responded to our invitation. We hardly need say that requests for detailed specifications, data for winding magnets and armatures, and similar matters which fall more appropriately within the scope of a consulting engineer's practice are not suitable for treatment by our Service Department, though many inquiries of this class are received; its aim is rather to serve as an encyclopædia of facts and data which are already in existence but which the reader is unable to set hand on—an electrical reference bureau, so to speak—and thus to serve the needs of the industry. We much prefer to receive inquiries by letter rather than by telephone, for many reasons.

The Institution of Electrical Engineers.

Summer Meeting at the North-Eastern Centre.

(*Continued from page* 970.)

On the Wednesday morning the North Tees generating plant of the Newcastle-upon-Tyne Electric Supply Co., Ltd., and associated companies* was inspected, luncheon being provided at the power station by the Company, which is the largest concern of its kind in this country. Its area of supply covers 1,600 sq. miles, populated by some two million people, and the number of generating stations running in parallel with the system is 34, their yearly output being approximately 1,000,000,000 kWh; the number of stations owned or operated by the Company is 20, their yearly output being approximately 900,000,000 kWh (200,000,000 of these units are generated by means of waste heat). The demand on the Company's system is 175,000 kW; the route length of cables laid and overhead lines erected is 1,550 miles; the route length of 66,000-volt cables and lines is 60 miles, and the route length of 20,000-volt cables and lines is 400 miles. The number of sub-stations is 626, whilst the horse-power connected to the system is 665,000, and the annual average rate of h.p. connected during the last ten years has been 30,600 h.p. The number of consumers supplied directly and in bulk from the system exceeds 100,000, those connected directly to the Company's system exceeding 60,000 (more than 16,000 new domestic consumers were connected during the year 1926). The number of collieries supplied is 180. The capital expenditure has been £11,700,000. Situated at Haverton Hill, in the County of Durham, on the north bank of the River Tees, opposite to the town of Middlesbrough, the site covers 56 acres, with a river frontage of nearly half a mile; "A" station was put into commission in 1920, and the first part of the "B" station in 1923. The former contains two 20,000-kW Metropolitan-Vickers machines, each consisting of a high- and low-pressure turbine, and two 10,000-kW 11,000-volt alternators, in tandem, running at 2,400 r.p.m. The turbines are of the single-flow type, in opposition, and the last stages of the low-pressure turbines are of the multiple exhaust design. The two generators are normally operated as one unit, but are coupled together through switchgear so that either can be used separately. The ten boilers, by Babcock & Wilcox, Ltd., each have a capacity of 42,000 lb. per hour. The steam pressure is 475 lb. per sq. in., and the temperature is 700 deg. F.; five boilers are fitted with reheaters, which raise the temperature of the steam to 520 deg. F. in its passage from the high- to the low-pressure turbines of each machine. There

Fig. 3.—The North Tees "A" and "B" Power Stations.

* See Elec. Rev., July 4th, 1924.

are no economisers; in their place air heaters have bee installed by means of which the hot gases passing fro the boilers are used to raise the temperature of the a supplied to the grates to about 400 deg. F. All t boilers discharge into one brick chimney with commo fan equipment. Provision is made for oil firing fi boilers. The feed water is heated, first, by steam draw at two stages from the low-pressure turbines, and the by steam taken from the high-pressure exhaust, its fin temperature being 300 deg. F. The pumps are ele trically driven, with steam-driven pumps in reserv and the air from the alternators passes to the boiler a ducts. The ash conveyors are of the suction type.

The "B" station contains one 20,000-kW "Metr vick" generator similar to those in the "A" statio and two 25,000-kW 11,000-volt Parsons sets, which co sist of high- and low-pressure reaction turbines and single alternator; the low-pressure cylinder is of t double-flow pattern with twin condensers. The speed 2,400 r.p.m., and in the case of these machines, t steam entering the low-pressure turbines is not r heated.

Steam can be interchanged between the "A" an "B" stations; in the latter, eight boilers manufacture by Babcock & Wilcox, Ltd., each have a normal capacit of 75,000 lb. per hour, 475 lb. per sq. in., and a tem perature of 750 deg. F. As in the case of the "A station, air heaters are used instead of economisers, an the feed water is heated by steam extracted from th turbines, but its layout differs from that of the "A boiler house in that each boiler has its own chimney an a separate equipment for the induced and force draught (fig. 3). The alternators are provided with

Fig. 4.—Bishop Welldon and Guests at Durham.

closed air circuit, the air being cooled by the condenser circulating water. The ash conveyors are of the water trough scraper type supplied by the Underfeed Stoker Co., Ltd.

The condenser circulating water pump house, which is common to both stations, contains four vertical centrifugal pumps manufactured by Gwynnes Engineer-

ing Co., Ltd., each being capable of delivering 1,560,000 gallons per hour. The main switchgear was manufactured by Messrs. A. Reyrolle & Co., Ltd. The generators feed straight into the mains; there are, however, two sub-stations on the site, in one of which the pressure is raised to 20,000 volts for supplying distant consumers, and in the other to 66,000 volts for linking-up the Company's stations on the River Tyne. The 44,000 kVA of step-up transformer plant now available is to be increased to 68,000 kVA in the near future. The network in Middlesbrough and other districts south of the river Tees is connected to the station by twenty cables laid in a trench dredged in the river bed at a depth of 30 ft. below low water. The control room is equipped with a large diagram showing the southern portion of the high-pressure system, which enables the engineer-in-charge to have full control of the distribution of load in this area. Employés are provided with houses on an estate laid out by the Company on garden city lines in the village of Billingham, about a mile from the power station. There are seventy-three houses, all of which are equipped for electric heating and cooking.

Fig. 5.—At the Hebburn Switchgear Works.

Fig. 7.—Assembling for the Official Photograph.

On the Wednesday afternoon the main party proceeded to Durham to visit the cathedral, the old monastry with its 14th century kitchen, library which contains the Cuthbert relics and Lindisfarne Gospels, and numerous other features of interest. Tea was served on the Deanery lawn by the kindness of Bishop Welldon, D.D.

Fig. 6.—Group at Armstrong College, Newcastle.

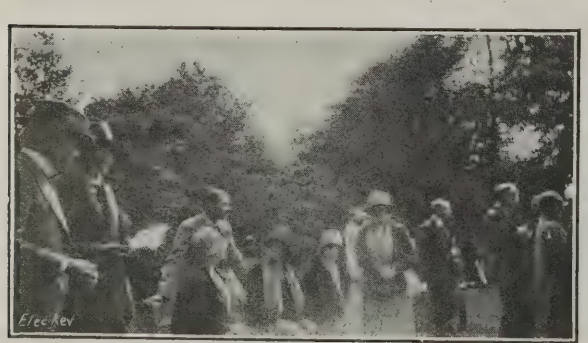
Fig. 8.—Some of Messrs. Reyrolle's Visitors.

Meanwhile, a subsidiary party had gone to the pit-head of the Blackhall Colliery of Messrs. Horden Collieries, Ltd., where tea was served by the Company, which also facilitated the visitors' descent to part of the underground workings. Situated on the sea coast about five miles north of Hartlepool, the sinking of this pit through heavily watered strata was completed in 1913; the colliery is electrically driven throughout in conjunction with the Horden and Shotton pits, which were already supplied with electricity by the Cleveland and Durham Electric Power Co. Turbo-generators are installed at both places, driven by exhaust steam from the winding, fan, and other steam engines, and operate in parallel with the C. & D.E. Power Co.'s system, which carries the peak load and into which surplus electricity is delivered by the colliery plant. The incoming 20,000-volt supply is delivered to the sub-station by three separate feeder cables and stepped down to 3,000 volts by means of three 1,500-kW transformers, all motors over 50 h.p., including those driving the winders, fans, and air compressors being operated at 2,900 V, 40 cycles, 3-phase; smaller surface motors are supplied from two 200-kVA 2,900/440-volt transformers. Two 100-kVA and one 200-kVA motor-generator sets have been installed for lighting purposes, and the larger electrically-driven equipment includes Belliss & Morcom air compressors (two of 535 b.h.p. and one directly driven by a "Metrovick" 1,175-b.h.p. motor), two 350-b.h.p. fans, three Sulzer centrifugal pumps of 710 b.h.p., one 125 and one 100 b.h.p. endless-rope haulage systems, and a 300-b.h.p. main and tail haulage set, whilst the screens, washery, saw mill, and fitters' shop are also motor driven. The electric winders at the North and South pits are duplicate Metropolitan-Vickers-Markham sets: their 1,500-h.p. motors operate at 2,700 volts, 3-phase, 40 cycles, with Weir liquid controllers and oil-immersed reversing switches.

To comply with the request for one free evening during the week, no formal plans were made for the Wednesday evening, which enabled a number of the visitors to the Deanery to remain longer in Durham City, a centre of learning and the mining industry, to see more of its cathedral and castle. Situated together upon an eminence within a horseshoe bend of the River Wear, the old castle was built to protect the Benedictine Abbey from attack, and was for centuries the fortress of the Prince Bishops of Durham, who possessed exceptional power and privileges, many of which were ceded to the Crown in 1836, and in that year the Castle was appropriated to the uses of the University of Durham, which was founded in 1832. Parts of the first castle, still extant, are acknowledged to be some of the finest ex-

amples of early Norman architecture, whilst the cathedral is of magnificent proportions; it is the shrine of the northern Saint Cuthbert, commenced in 1093.

On the Thursday one party toured the Ford potteries of Messrs. C. T. Maling & Co., Ltd., who claim to be the oldest private firm of white earthenware manufacturers in the British Isles; the business was started 165 years ago, and the "A" pottery, which has converted 120 tons of clay into nearly half a million pots per week, has been entirely driven by electric power for the last 25 years, the largest grinding motor being of 200 h.p. All the machinery in the "B" pottery is now also electrically driven, over 60 motors of from 50 h.p. downwards being in use, the plant being capable of converting 200 tons of clay into nearly a million articles of ware per week. Messrs. Maling are said to be pioneers in the use of leadless and innocuous glaze, which has been employed by them for at least 27 years. They



Figs. 9 and 10.—In the Precincts of the Deanery at Durham Cathedral.

were the makers of the handsome souvenir ware distributed to each participant in the I.E.E. meeting this year.

An alternative Thursday morning visit was to the Elswick works of Messrs. Sir W. G. Armstrong, Whitworth & Co., Ltd., which for a period of 37 years supplied an unbroken line of chief constructors to the British Navy, a remarkable record. The present works of the Company at Elswick, Scotswood, and Openshaw (Manchester), and the shipyards cover more than 300 acres (200 shops), and can normally afford employment for 23,000 people, which figure was at times trebled during the late war. H.M.S. *Nelson*, the largest and most up-to-date warship completed recently, happened to be lower down the river at the time of the visit. The Elswick works were started in 1847 to manufacture

Figs. 11, 12 and 13.—Snapshots During Tea on the Deanery Lawn at Durham.

hydraulic cranes, and bridge and other constructional work was also undertaken. The Company's first connection with the War Office was in 1854, and the first three-pounder breech-loading rifled gun is still preserved and may be seen at Elswick. In 1863 British Government orders ceased, and W. G. Armstrong and Co. and the Elswick Ordnance Co. were amalgamated under the title of Sir W. G. Armstrong & Co., and directed their energies towards the acquisition of a foreign connection for ordnance. It was not possible to manufacture guns for long without becoming interested in warships, and shipbuilding was carried on a Elswick until 1918, when it became essential, owing t the increasing size of ships, to find a yard below th Tyne bridges, and in consequence the Armstrong yar came into being; apart from ships built during th late war, the new yard achieved some wonderful result in the repairing of damaged ships. In 1883 the stee works at Elswick were opened for the supply of gu steel, as well as of steel castings for marine, locomotive and general engineering work. The steel foundry stil continues, but the main supplies of steel are now fur nished by the Openshaw works of the Company at Man chester. Acquired in 1897 when the business of Si Joseph Whitworth & Co. was absorbed, the last-named works include the armour-plate plant as well as the machine tool and other departments. In 1897 works were started at Scotswood for the manufacture of ammunition, and since the late war have been reorganised for the manufacture of locomotives, marine, and gas and oil engines, as well as shell. In 1915 the works at Gateshead were purchased, and the subsidiary companies which have been acquired from time to time together normally employ some 30,000 workpeople.

After luncheon at the Grand Assembly Rooms, Newcastle, alternative visits on Thursday afternoon were to the Ford Potteries and to the fine recently-opened library of Armstrong College, Newcastle's seat of learning, which is an integral part of the University of Durham. The College was founded in 1871, and a special feature of the Electrical Engineering Department is the large use made of three oscillographs by students in every year. A recent gift is an experimental steam turbine, presented by Sir Charles Parsons, and the Dean Lake Laboratory of Electrical Engineer ing contains machinery aggregating 300 h.p. in small sets, transformers, and testing apparatus. The first experiments with high-voltage electroculture in this country were made 25 years ago in conjunction with the late Prof. Lemstrom by the Electrical Engineering and Botany Departments, whilst more recent work has been connected with the adaptation of electricity to coal mining, with the electrical ignition of gases, and dielectrics, with which Dr. W. M. Thornton is closely associated.

(To be continued.)

Swiss Railway Electrification.

Some particulars of the electrical equipment at, and constructional details of, the Seebach outdoor sub-station, one of 22 sub-stations which are being erected to supply 1,000 miles of route of the Swiss Federal Railways.

By H. W. SCHULER, Electrical Engineer, Swiss Federal Railways.

THE Swiss Federal Railways are electrifying their lines according to a programme which provides that by the end of 1928 one half of the system, including about 1,000 miles of route, will be entirely electrically operated. Over the electrified portion more than 75 per cent. of the whole traffic will be carried. Four Federal Railway power stations and two private companies will supply the energy for this service. Single-phase current at 15 kV will be generated by hydro-electric machines and transmitted to different feeding points, either by 15-kV underground feeders or 60-kV overhead transmission lines. The energy transmitted by the 60-kV lines will be transformed to 15 kV in 22 sub-stations distributed along the railway lines. Of these, five of the indoor type were built and equipped between 1919 and 1922; they are situated along the St. Gothard line between Lucerne and Chiasso. As the building costs of these were rather high, the type was abandoned in favour of the outdoor sub-station. First calculation and then experience showed that a saving of from 25 to 30 per cent. could be effected by installing all the h.p. apparatus and lines in the open. A reduction in the time expended in erecting the apparatus, the clear and simple lay-out of the h.p. lines and connections, and the ease with which extensions can be made are some of the advantages which were found to be inherent to outdoor sub-stations. Between 1923 and 1925 nine such sub-stations were built, and provision has been made for eight more to be put in operation.

Fig. 1.—Seebach Outdoor Sub-station.

The sub-station at Seebach, fig. 1, which was ready for service in August, 1925, represents the most recent type of outdoor sub-station so far built on the system. The structure lies in a hollow, and the apparatus is partly concealed, a matter of great importance in Switzerland, and especially in the environs of Zurich.

A 60-kV transmission line, consisting of four 95-mm. copper cables, arranged in two independent loops, transmits the energy from the sub-station at Brugg, which is fed by a transmission line coming from the St. Gothard power stations. A branch line from this will supply the sub-station at Steinen. Space and apparatus are already provided for a transmission line to Gruze, where a sub-station is being built for feeding the lines going to the eastern part of Switzerland.

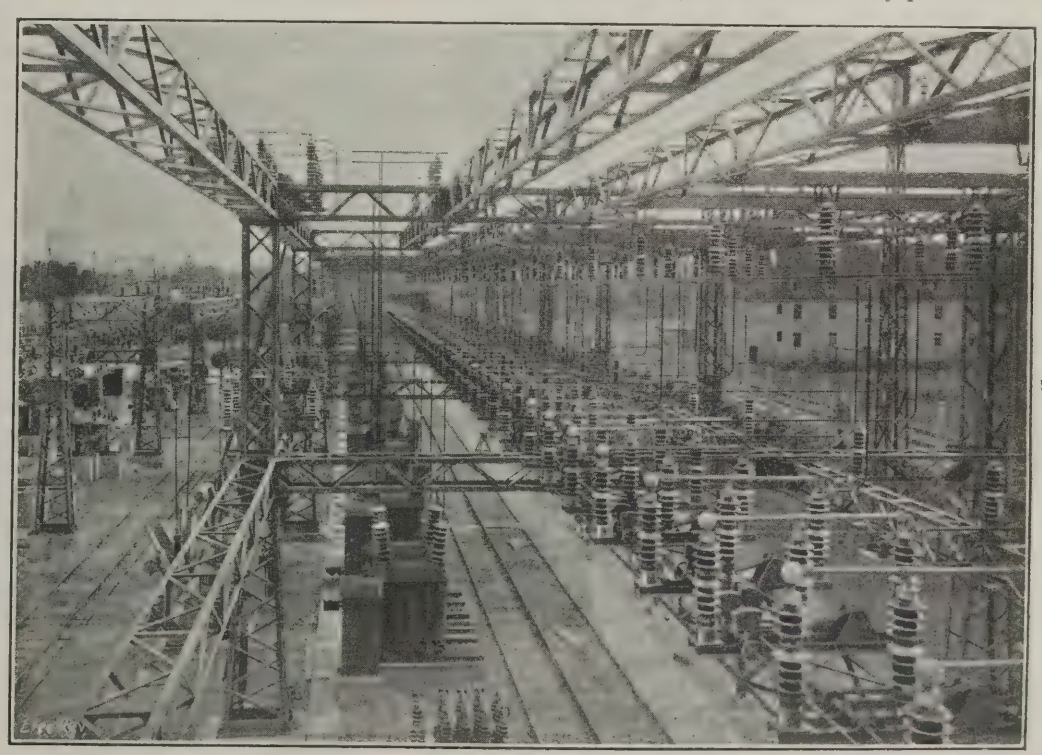


Fig. 2.—Switching Arrangements at Seebach.

The Seebach sub-station has to feed the contact lines of the different railroads branching off to the suburbs of Oerlikon. Duplicate bus-bars are provided. The transmission lines to Brugg-Rapperswill (Steinen) and Gruze are so arranged that one of their two loops goes to one half of the bus-bar system, and the other loop to the remaining section. By this arrangement numerous switching possibilities are given by which any service emergency can be met. Each transmission line

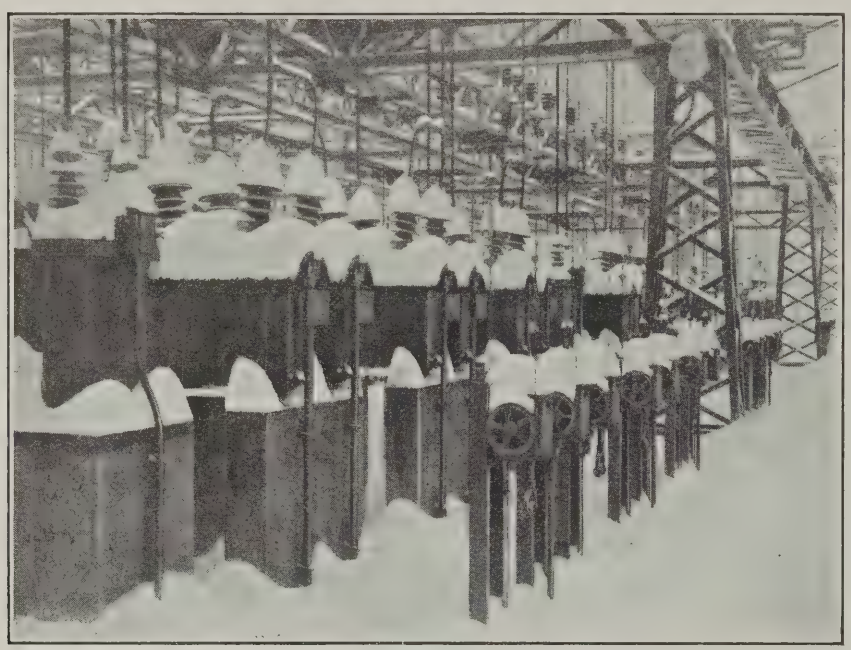

Fig. 3.—Circuit Breakers under Winter Conditions.

is equipped with pressure and current transformers for the measuring instruments and overload relays. Special earthing knife switches are also provided on the lines. Fig. 2 shows the switching arrangements; the transformers are connected to the two bus-bar systems in a similar manner to that employed for the transmission lines. The circuit breakers for the 60-kV lines and the transformers are designed to carry 200 A at 80 kV and to break a load of 450,000 kVA. They are constructed of two single-pole units coupled together by a suitable link connected with the operating mechanism. This mechanism, with the breaker-tripping apparatus, is mounted in a sheet-iron box separate from the breaker. Both hand operation and electrical remote control are provided for. The closing solenoid operates the breaker in half a second, its operating load being 38 A at 220 V. When opening the circuit, the breaker first inserts a 5,000-ohm resistance, and the remaining load is then interrupted by six contacts simultaneously. Each circuit breaker complete weighs 12,540 lb. and contains 4,840 lb. of oil. The 15-kV sides of the transformers are connected to the corresponding bus-bars by s.p. switches, the bus-bars being in turn connected to the contact-line bus-bars through main feeding breakers. These are designed for a working pressure of 24 kV, and have a breaking capacity of 250,000 kVA; they each have four contact bridges which operate in succession when opening the circuit, introducing suitable resistances at the intermediate stages. In parallel with each main feeding breaker is a 2,000-ohm testing resistance and the current transformer of an ammeter for indicating the line conditions when the breaker operates on short-circuit, and so preventing the closing of the breaker on "dead short." The resistance will carry its "short-circuit" load, 7.5 A, for 10 minutes without getting overheated. Should it become too hot, a maximum-temperature indicator will signal the abnormal condition to the operator.

The feeders to the different contact lines are branched off the contact-line bus-bar by means of small oil circuit breakers of limited breaking capacity. Each one of these lines can be earthed by a special knife switch, and sectionalising knife switches divide the bus-bars up according to the different railroad lines which have to be fed. In the case of a disturbance in one of the main feeding breakers, the line circuit breakers belonging to it can be connected to the next main feeding breaker by closing one of these knife switches. Fig. 3 shows these breakers under winter conditions. The single-phase transformers are designed for a continuous output of 3,000 kVA at 0.75 p.f. On the 60 kV side the middle point of the transformer winding is connected to earth through a resistance of 60,000 ohms. A current transformer in the earth circuit trips by means of special relays the transformer circuit breakers in the case of an earth developing on the line. On the 15-kV side one end of the winding is directly connected to the rails of the railroad passing by the sub-station. The windings consist of circular coils, concentrically arranged and held together by spring clamping rings. The end turns are especially heavily insulated to provide against damage due to excess voltages, the puncture voltage between turn and turn being at least equal to the line voltage. Resistance thermometers are installed in the upper coils of the 15-kV windings. Any serious change in the oil level in the transformer tank is automatically signalled to the switchboard operator. The bushings are filled with oil, those on the 15-kV side being in direct connection with the oil in the tank, those on the 60-kV side being separately filled with oil

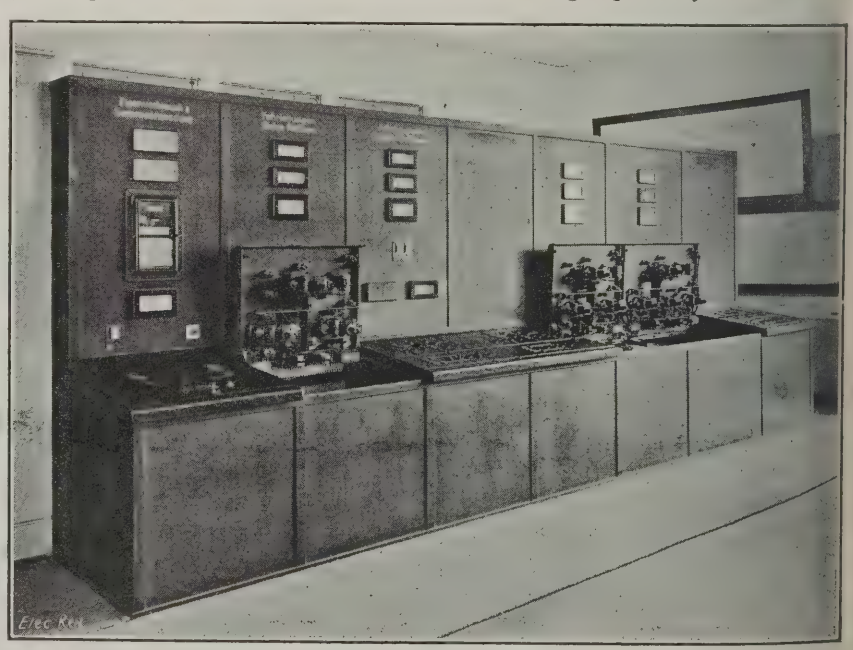

Fig. 4.—Control Board.

and provided with a top glass to allow for expansion of the oil. No special lightning arresters, either on the 15- or on the 60-kV side, are installed, so far with no serious consequences.

All the oil-containing apparatus installed outdoors is mounted on concrete foundations, while the knife switches and bus-bars are mounted on an iron girder

framework. The knife switches are operated from the ground by cables and levers. All the bus-bar and other h.p. connections are by means of copper pipes of 30-mm. external diameter. Tracks are led to each piece of heavy apparatus to facilitate its transportation to the repair shop, the concrete foundations being at a suitable level. All the girders and apparatus are earthed by means of copper strip.

The girder construction weighs over 100 tons and covers a surface of 25,000 square feet.

After the installation was completed, a pressure of 120 kV was applied to the 60-kV apparatus for from 10 to 30 sec. at intervals of 5 minutes. The 15-kV equipment was subjected to 50 kV for 5 minutes. The bushings and insulators had also to resist for 5 minutes testing pressures of 57.5 and 150 kV respectively, under a 45-deg., 4-mm.-per-min. rainfall.

All the measuring, signal and remote-control wires installed out of doors are lead-sheathed.

The switch-house is situated above the cable room and overlooks the whole of the outdoor equipment. Fig. 4 shows the control board for the 15-kV switchgear; signalling lamps and position indicators for the knife switches are so arranged as to represent diagrammatically the lay-out of the equipment. The auxiliary switchgear for the sub-station is mounted on a separate switchboard. Two 50-kVA, single-phase transformers give a 220-V supply for heating purposes and for two 20-kW motor generators for supplying d.c. A 220-V storage battery supplies the lighting and remote-control equipment, and a small 12-V battery serves for feeding the signalling circuits. A system of telephones connects the switchroom, the railroad, and the State system.

At present only three of the main transformers are installed, and two of the six transmission lines are in operation. Arrangements have been made to facilitate extending the sub-station, if necessary, in the future.

Ironclad Switching Systems.

A Review of the Subject from the Point of View of the User.

By a Supply-Station Engineer.

THE debate which has been started in the Electrical Review regarding ironclad draw-out switchgear is one that interests every follower of progress.

It has to be borne in mind that Mr. Thomas Carter, M.I.E.E., in introducing the subject has limited his remarks to a certain range. Taking his first point, the superior mechanical principle employed, it must be admitted that less energy is required to remove a horizontal switch to the isolated position than in the case of the vertical type. This object is achieved at the expense of floor space.

Regarding the mass of the frames, in the vertical type, by reason of the increased height, the supporting structure has to be of fairly stout section to give the necessary stiffness; in the horizontal form, a cantilever construction has proved in the larger sizes of gear to be less economical than the form in which a frame of uniform section along the whole length of travel is used. When the question of accessibility is considered, such as attention to the contacts of an isolated switch, the tanks are removed by merely lowering them in the vertical type, which here possesses a great advantage; a small passage-way at the rear enables ready access to be obtained to all parts.

In the power station a separate supporting structure is not necessary for the vertical type; cross beams of suitable section forming the floor for an upper deck can be arranged in the design of the building. Guides similar to those used for lifts can be provided for the tanks, and very little obstruction to inspection is then experienced.

Work has to be done in the space between bus-bar and feeder orifices, and the selector plugs. In the case of the horizontal gear this is no easy job; one has for the moment to assume the attributes of a snake, which is a difficult task for those inclined towards rotundity. On his score the vertical gear, if provided with more than one point of access, is much better. Increased distance between orifices and plugs can easily be provided in the vertical gear.

With the usual constructions of horizontal gear, access to the back main contacts is difficult, and front access is obstructed by the presence of the lowering truck; hence the complete removal of the tank and obstruction of the passage during maintenance work is usually forced upon the operator. Self-contained lowering gear certainly modifies the case, but does not solve the other difficulties that arise.

The argument that both types need the same two plane motions is weak, in that whilst it embodies an undeniable truth, it is not practical. The complete removal of the tank or the circuit breaker in gear of good accessibility need only occur in a small percentage of the number of operations for isolating and inspection purposes.

In a large power station there is no great objection to the provision of a runway for a removal truck to run the whole length of the switchboard directly underneath the switch tanks of vertical gear.

It may be admitted that looking into orifices is easy on horizontal gear, but that is only part of the story; when all is said and done, how often does one need to look into these places? When work has to be done on these shrouded contacts, the complete removal of the horizontal switch is usually required; the vertical switch is merely lowered to the bottom or lowest position as a whole.

My previous remarks apply to the operation of earthing feeder contacts where through switch earthing has not been adopted, and to the cleaning or removal of plugs for selection purposes. Practical experience is here the only guide; if those who discuss this point say otherwise, they have surely forgotten theirs. Mr. Carter, when he speaks of the accessibility of horizontal-gear plugs, has in his mind only the single bus-bar type; accessibility is reduced when two or more bus-bars are installed, and on large gear access to the middle phase, bottom bus-bar selector plug is by no means easy.

The cable box of a horizontal switch is a neat arrangement and houses the necessary cable terminals and current transformers in a compact construction. If access to current transformers is desired, the designs at present made to provide this feature seem to indicate that the horizontal gear does not lend itself well to such a provision.

An easily accessible cable dividing box should help towards more satisfactory jointing, but beyond that, the situation of the box is not in itself very important. The important feature is the arrangement of the cable; sharp bending must be avoided.

To my mind the logical place for the cable runs of the vertical gear is overhead, with suitable protection against possible rising flames; the cables could be laid upon a concrete platform over the full width and length of the passage-way at a height level with the top of the bus-bars. The extra height need be little, and easy bends to the cable boxes, suitably designed, could readily be allowed.

The over-all height from the bottom of the cable basement need not be larger than from the floor level to the top of the cable chamber in the new lay-out.

In basements it is common practice to run the cables along the walls; in this case all the cables are liable to damage from fire at any one switch. If faced with the problem of installing either gear, whose service happens to be important, in limited headroom, I should consider the advisability of providing a cable passage of narrow width, with wall cleats for the cables, and a brick wall dividing the cable-way and switchroom. In the case of basements, if neither is provided with cable runs below the floor, horizontal gear may score by a foot or so in the matter of headroom. In the matter of the width required, horizontal gear is at a distinct disadvantage.

With regard to the question of damage to bus-bars, it is reasonable to expect that a serious explosion may cause damage to both types, as in either case the bus-bars are situated but a short distance away from the seat of trouble—the switch tank.

On vertical gear, failure of the top plate, or blow-off of the tank, is likely to do damage to the bus-bars. Perhaps, to meet this point, the bus-bars of vertical gear may be placed at one side and not vertically over the switch tanks; in this case, no inherent advantage of either type is of much importance. A failure from explosion occurs at the weakest point, and I see no reason why, with a clear space underneath, switches should seek heaven as their home. Overhead bus-bars are at a disadvantage when oil fires occur, and are then more likely to be damaged unless suitably protected. For those who prefer everything except bus-bars to be metal-clad (and recent installations demonstrate the existence of this school of thought), bus-bars can be mounted in cubicles on a floor above and the usual ironclad switchgear beneath; this should satisfy all doubts regarding the vulnerability of bus-bars.

In the event of severe electromagnetic forces, the bus-bars of the horizontal as well as the vertical gear are subject to reactive forces, which are equal and opposite; from a mechanical point of view the vertical downward isolating style can be designed so as to be capable of coping with the stresses in a direct line, but in present types of horizontal gear this is not so true.

The mounting of two circuit breakers in one tank does not give sufficient advantage to justify the extra outlay; it has disadvantages of great importance, neutralising to a large extent the value of the provision of duplicate bars.

Oil selector switches of good design are costly, and I hold that the capital is more economically spent on duplicate circuit breakers. Plug selection is slow in operation; speed in operation adds much to the value of duplicate bus-bar systems and speed in selecting is likely to be of increasing importance in power stations where the division of bus-bars has to be carried out. For important circuits, duplicate circuit breakers offer real advantages, and interlocking arrangements are less complicated.

If, on the occurrence of fire, it were feasible to play a hose upon the flames without causing damage to near-by switchgear, one could almost say that ironclad gear was as safe as could be. But talking of fires, whether likely or not, is disconcerting when the subject is switchgear, and perhaps not very tactful. Protection from dripping water is an inherent quality of the vertical gear; when dampness has to be considered, as is in some cases important, neither type scores.

The horizontal draw-out pattern was developed in the first instance, I believe, for single bus-bar systems; then their size was moderate, but now the largest are far from small. Switching practice is undergoing a change; the switch-houses of large power stations are designed to suit the gear, and a switch is now given a good deal of respect and is not put in an odd corner as heretofore. One or two feet of space must not unduly interfere with design.

Horizontal gear has served its users well, though its life has to a large extent been blighted for a long time owing to the disfavour shown to ironclad gear in the past. Vertical gear, with certain minor improvements in design, will, I think, take the field, albeit the rightful ground of the other's preparation, for the moderately large and super-power stations' requirements.

Where oil-filled gear is used, precautions must be taken, by division into compartments, to prevent any large quantities of oil running away from bus-bar chambers. Drains and channels in floors can help to prevent burning oil from spreading in the event of tank failure.

The two types have here been considered purely with regard to their inherent qualities; where present designs have been referred to, no one design alone has been held in mind.

I hold that the alleged weaknesses attributed to the vertical draw-out gear by correspondents are not incapable of improvement by design towards the attainment of a complete solution of all difficulties. The vertical downward draw-out is meant where not specifically mentioned. In conclusion, I would say, to preclude any suggestion of manufacturing interests, that I am not connected with any manufacturing concern—a fact which will, I think, be evident from the diversity of my criticisms.

Japan and the Electrical Industry.

By A. RIDDLE, A.C.G.I.

THROUGHOUT the short history of the electrical industry there is nothing to equal the rise of Japan as a power-producing country, or of its people as a power-using community.

Electricity is in general use, both for lighting and power, to an extent which, to the conservative English mind, is almost incredible. Throughout the whole country there is but one illuminant, and it is almost impossible to find a house which does not use electricity for lighting at least. In Tokyo itself, a city of two million inhabitants, the proportion of houses not wired for lighting is a negligibly small portion of 1 per cent. The same applies to the rural districts, where even the most distant settlement seems to get a connection on to a transmission line. Most of the house wiring, it is true, would not satisfy the demands of the English insurance companies, but this leads one to think that England perhaps is suffering from too much legislation in this respect. Throughout Japan all the dwelling houses are built of timber and paper; and in such a country, where the effects of a fire would be devastating, electricity is regarded as the only safe illuminant, coal gas being rightly regarded as a dirty, dangerous, and poisonous thing to have about the house. Further, the use of electric power is becoming more and more popular both for cooking and heating, and applications for connections are being received at such a rate that in many cases the supply companies are finding great difficulty in keeping ahead of the demand. Farmers, too, attracted by cheap rates, are rapidly adopting electric power for pumping, irrigation, sericulture, the tea industry, and in all the subsidiary agricultural operations.

The reason for such a general use of electric power is

apparent from a study of the physical characteristics of the country. Japan is a mountainous country with abundant water supplies, huge natural reservoirs, narrow gorges and countless waterfalls, so that it is one of the most easily adapted countries in the world for hydro-electric development, and something like 80 per cent. of the power generated in the country is developed hydro-electrically. There are some very fine examples of steam stations, but the majority of these plants are used for standing by, or for assisting at the low-water periods of the year. Transmission and distribution, too, present a much easier problem than in most countries, for by far the greater part of the population is congregated in the valleys, so that a concentrated load is almost always assured, and in no case is the load very far removed from the generating centre. In addition, there are abundant supplies of home-grown timber suitable for transmission lines, and copper is mined in quantities more than sufficient to meet all home demands. Endowed, then, by Nature with such resources and conditions, Japan has been enterprising enough to develop them to the full, with the result that ample supplies of cheap power are available everywhere, and further schemes are being projected to ensure adequate supplies of power in the future. The rate at which the demand for power is growing may be gauged by the fact that one company, the Tokyo Dento Kabushiki Kaishu (Tokyo Electric Light Company) has an available plant of 600,000 kW, which is almost double what it was before the great earthquake of 1923, and more than treble the figure for the early part of 1921. This figure of 600,000 kW is made up of 313,000 kW in hydro-electric stations, and 70,000 kW in steam plant, while the balance of 217,000 kW is purchased from subsidiary companies. The company owns over 2,000 miles of e.h.p. line and a further 48,000 miles of distribution line.

A study of the financial position of this company is of interest. The company commenced business some 40 years ago, and it now occupies the foremost position in the industry, with a stupendous paid-up capital of 345 million yen (10 yen equals £1 approximately), and incidentally it is the largest limited liability company of any sort in Japan. Although the amount of capital is not the only criterion of the position of the industry, it is indicative of its scope, and there are about 15 supply companies in Japan which have a paid-up capital of over ten million yen.

This company operates over an area of about 9,000 square miles in the Tokyo district, and has over 1¼ million lighting customers on its books, and a further 50,000 taking power. In spite of the magnitude of these figures, it is of interest to note that in April of this year the Ministry of Communications rejected an application from the company to extend its area of supply on the grounds that the power available is not, and has not been, sufficient to meet the demand. The view of this authority is that in 1929 there will be a shortage of power in the company's area; the reply of the company is that it is taking all steps necessary to ensure an adequate supply in the future.

A company of this size might appear to be too ponderous for successful management. Such, however, is not the case; for, while putting aside ample reserves, a dividend of 11 per cent. per annum has been maintained over the past three or four years. Indeed, this figure is just the average paid in 1926 by 18 of the largest supply companies whose financial position has been studied.

There are two systems in general use for charging purposes. One, a flat rate per mensem for a lamp of given consumption, which is accompanied by a reduction in the rate for an increase in the number of the lamps in use. The other system is the meter system, which promises in time to displace the flat-rate system entirely. The average charge for lighting is about 20 sen (about 5d.) per kWh, and for power about 7 sen (1.75d.) per kWh. These figures are for the small consumer. Big consumers are, of course, given special rates and so are the farmers. Farmers are given cheap rates owing to the fact that during the summer months, when the demand for power for domestic purposes is at its minimum, the rains are heaviest, and there is a big surplus of power available from the late spring until the early fall. It is just between these times that the farmer's need for power is greatest. By the organisation of a farm electrification society a campaign was started to educate the farmers concerning the possibilities of electricity, and the response has been extremely satisfactory.

Regarding the power plant in use, most of the Japanese engineers have a strong leaning towards American machinery, chiefly, perhaps, by reason of the large use of hydro-electric plant. Good examples of Swiss, German, and American water wheels are found, but one good station has four Pelton wheels, each rated at 10,000 h.p., by Boving. The Japanese manufacturers, however, are rapidly introducing their own designs, and in a few years outside manufacturers may experience great difficulty in finding a market for their products in Japan.

As far as steam plant is concerned, one hears nothing but praise for the British turbine and generator, while for steam raising, Babcock & Wilcox boilers are rightly regarded as the world's best. In one station at Nagoya, belonging to the Toho E.P. Co., were installed boilers by Messrs. Babcock & Wilcox, Ltd., generating 648,000 lb. per hour at 350 lb. pressure. These boilers are the largest ever erected in Japan, and it is the first plant to adopt high steam pressures. The generators were by the General Electric Co.—two of 35,000 kW each; but the station will have an ultimate output of 140,000 kW. It was cheering to see the condensers made by Messrs. W. H. Allen and British drive to nearly all the auxiliaries. The coal-handling equipment, however, was of Japanese design throughout.

The time taken to erect the station is worthy of note, as it is typical of the electrical movement in Japan. The design work of the stations was commenced in February, 1924, and the work of construction began in the following October. By October, 1925, the first 35,000-kW set was in commercial operation. This machine was dismantled after the shop test at Schenectady, and not only the windings of the stator, but also the laminations came separate from the stator casting. Those who are acquainted with the time usually required for setting up a big machine and putting it into operation will be interested to know that the entire work was completed in three months after its arrival in Japan.

Great attention is being paid to switchgear, which is nearly all of American make or made by Japanese affiliated companies, to American designs. Here, again, British manufacturers will have great difficulty in finding a sale for their goods in Japan owing to the lower price of the locally-built product. Nearly all the power is dealt with at outdoor transformer stations, as much as 200,000 kVA being operated at one such station, and Japanese-built switchgear up to 154,000 volts is giving excellent service.

The switchboards at all the modern stations are of the very highest class, and the designs generally show great attention to detail. One particularly good example of a Japanese-built board is at the Aso station for the Toho E.P. Co. The switchgear is controlled from a benchboard equipped with mimic buses and mimic disconnecting switches to facilitate speedy and accurate operation; and test terminals are provided so that all meters, instruments, and relays can be quickly and easily tested. Temperature indicators are also mounted on the control board so that the heating of the windings of the generators and transformers can be checked under all conditions.

As far as power cables are concerned, the market for British cable is practically dead. Paper cables are now being made in Japan up to 33,000 volts, and cables are being exported. One or two of the big power companies, however, placed useful orders for e.h.p. cables in German hands during 1926. The cable-making industry

is being pushed forward, and although the value of the cables imported during the past few years shows an upwards tendency, the increase is very small compared with the increase in value of the cables manufactured in Japan. The situation regarding insulated wires is even worse. The post-war figures for the value of imported insulated wires fluctuates considerably with a general tendency to rise, but the values in all cases are considerably less than the figures for 1912 and 1913, and this in spite of the enormous increase in the wiring business of the country.

The import figures for boilers and electrical machinery have shown a general tendency to increase during the past four or five years, and in view of the continued developments there should be good markets for all big plant for the next few years, but competition will be keen, not only with America, but with Japanese manufacturers as well. The local manufacturers are themselves building turbo-generator sets of 20,000 kW, and for marine work turbines of much greater output have been built.

Another department of the industry which has advanced considerably during the past few years is the manufacture of porcelain. The Japanese, for many centuries skilled in the manufacture of porcelain, have of late years turned their attention to the manufacture of high-quality electrical porcelain. Insulators for voltages up to 220,000 are being made by several firms, and the porcelain work is always of the best. The brown glazing, however, in some cases, is not up to the best standards, and the ironwork leaves a considerable margin for improvement. All the Japanese transmission lines up to the highest voltages are now fitted with locally-made insulators. 154,000 volts is the highest in operation at present, but lines at 220,000 volts are projected. An export trade is being built up, and there are increasing exports to India, Canada, and the United States.

Concerning the future there is still a great possibility for our manufacturers of large plant, as big developments are being projected for several years ahead. The Toho E.P. Co. is about to float a new company with the object of exploiting certain water resources. The scheme involves the construction of power plants with a capacity of 100,000 kW, together with transformer stations and transmission lines. The estimated cost of construction is 50 million yen for power stations and a further 10 million yen for sub-stations and transmission lines.

The Shinetsu E.P. Co. is also planning a hydro-electric station on the Shinano river, with a probable output of 160,000 kW; and the Tokyo E.L. Co. is preparing plans for a steam station on the outskirts of Tokyo with an output of 30,000 kW.

One of the last acts of the Ministry of Railways under the recently deposed Wakatsuki Cabinet was to sanction the expenditure of over 100 million yen on the development of several electric railways.

One of the direct results of these developments is that the Japanese, long seeking an outlet for their ever-increasing population, are turning their attention to an alternative by introducing new industries or developing old ones. The result is that the exports of the staple manufactured goods, particularly raw silk, cotton tissues and yarns, knitted goods, paper, pottery and porcelains, show a big increase over those of the past four or five years, and it is likely that this increase will continue.

True it is that Japan is at present passing through a financial crisis, but this could, and possibly should, have been met some four or five years ago. Some of the smaller banks are bound to crash, and some adjustment of economic conditions will follow, but this may leave the country in a healthier and fitter condition to compete for the world's trade.

British manufacturers should mark that these people, physically and mentally alert, and for centuries highly skilled as artisans, are determined to take a leading place amongst the manufacturing nations of the world, and that they are putting a tremendous energy into modern manufactures, with a decided inclination towards the electrical industry.

Wireless Batteries.

Some suggestions as to the correct methods of charging various types of batteries and of equipping a battery-charging depot.

By PAUL D. TYERS.

ALTHOUGH the actual charging of an accumulator is quite a simple matter, and should present very little difficulty even to those who have only a rudimentary knowledge of electricity, when one is confronted with the problem of charging a large number of wireless accumulators the procedure is far from straightforward.

The chief difficulty lies in the fact that the number and capacity of cells which have to be charged are never constant, thereby necessitating a considerable amount of flexibility in the charging plant. The position is further complicated by the fact that the trader may be called upon to charge simultaneously perhaps a six-volt 60-A (actual) cell and a two-volt slow-discharge small-capacity cell. Obviously, it is very inefficient to use the same plant for charging both types of cell.

When the available supply is d.c., the best method of charging a moderate number of batteries is, of course, to connect them all in series and simply put them across the mains in series with a suitable resistance, so that the charging current is reduced to the maximum charging rate of the smallest cell. The more nearly the total voltage of the cells in series approaches that of the supply the more efficient will the system become, in so far as cost of charging is concerned. If only a few cells were connected in this way a large amount of power would be lost in the series resistance, and the cost of charging two or three cells would be almost prohibitive. In fact, it would show no useful profit. If the charging rates of a number of cells are very different, it is once more inefficient to use a general series connection, reducing the charging rate to the maximum for the smallest cell, since the small cells would be charged long before the others. Very small cells, such as the well known Exide D.T.G. and D.F.G., are very conveniently charged from direct-current mains by connecting them in series with carbon-filament lamps, which can be paralleled until the desired charging current is obtained.

When the supply available is alternating current, much greater flexibility can be obtained. The current, of course, has to be rectified, and as there are so many forms of rectifiers or complete charging plants now on the market, each possessing some particular advantage, it will be advisable to consider them in some detail. Alternating-current charging plants can be roughly divided into three classes: motor generators or dynamos driven by a.c. motors; synchronous rectifiers; and dis-

charge tube rectifiers, such as mercury-vapour lamps or discharge tubes of the type used in the "Tungar" or Philips rectifiers. Should an a.c. motor be available, the simplest form of charging plant would probably be a shunt-wound dynamo driven by the motor. The output rate of the dynamo will be considered later in these notes. The synchronous rectifier is, in many respects, preferable to a motor generator, since it is less complicated mechanically. Moreover, it is somewhat easier to maintain in good running order, the only attention required being that of keeping the rectifying brush-gear and commutator clean. The output of a synchronous rectifier is also very easily controlled by the use of a suitably tapped transformer. There are several excellent plants of this description on the market at the present time, and they are supplied with the necessary switchgear. The third class of rectifier, the discharge tube, may be divided into two groups, the mercury-vapour lamp and other discharge tubes. Discharge tubes, such as the "Tungar" and Philips rectifiers, are incorporated in complete chargers, and are suitable for delivering comparatively small outputs. This type of plant is best suited to the dealer who has only a few cells to charge more or less regularly. Such apparatus possesses the advantage of requiring no attention whatever, since there are no moving parts. The mercury lamp is, perhaps, one of the best rectifiers to use when a large current is required. The writer has had experience of this type of apparatus working at fairly high currents, with very excellent results. One advantage of the discharge type of rectifier lies in the fact that if the supply fails, the cells cannot discharge through the apparatus, thereby obviating the necessity of complicated cut-outs or other form of protection gear.

One of the most important, and probably the most difficult, points to decide when installing a charging plant is that of its rating. The first step is obviously to estimate the number of cells that will have to be charged, and the number that may require to be charged at any given time, presumably, a full working day. The rating can then best be determined by adding about twenty-five per cent. to the total wattage which has to be dealt with during a full working day. Suppose, for example, this amounts to 500 W, one next has to consider how this output is to be delivered from the plant. For example, one might have a 50-V plant delivering 10 A, or a 25-V plant delivering 20 A. If all of the cells were to be charged in series, one would require a high-voltage low-current plant, while, if the cells were to be charged in parallel, the converse would be true. It has already been pointed out that where cells of various voltages and capacities will have to be charged, it is almost essential to utilise some form of series-parallel connection. In this case some compromise has to be adopted. For moderate-sized installations it is usually found convenient for the maximum current to be not more than twice that of the maximum charging rate of the largest cells which are likely to be obtained. If the number of cells is likely to be small, the amperage may then be conveniently chosen at a little more than the maximum for the largest cell. It is almost impossible to charge very small cells from a big plant with any reasonable degree of efficiency unless a comparatively large number can be connected in parallel. Charging stations which cannot conveniently reduce the rate below two or three amperes are well advised to charge small cells, such as the D.T.G. and D.F.G., from a large accumulator through a small regulating resistance. It is absolutely essential that this type of cell should not be charged at too high a rate.

Some care should be exercised in the layout of the charging system, the most desirable feature being that of the separation of the cells and bus-bars from the plant. A room in which a large number of cells is constantly being charged rapidly becomes filled with very corrosive acid fumes, and these are likely in time to damage the apparatus. If possible, the plant, switchgear, and other apparatus should be kept in one room, and the various bus-bars and accumulators located in another room, which should be well ventilated. A very good arrangement consists in taking the output from the rectifier through fuses and an automatic cut-out, if the rectifier is of the type requiring one, to a series of feeders, each provided with a switch, ammeter, fuse, and a small regulating resistance. These should then be led to the charging room, a common negative bus-bar being employed, and, preferably, differently coloured positive bus-bars being connected to the feeders.

The ideal position for an accumulator during charging, and one which is recommended by fire insurance companies, is upon a glass plate mounted on a lead-covered bench or shelf. If more than one shelf is used, the distance between them should be several feet, in order to minimise fire risk from celluloid cells.

No modern charging depôt is now really complete without facilities for charging high-voltage accumulators. Perhaps one of the best arrangements is the "Tungar" high-voltage unit, which utilises a high-voltage low-current valve. High-voltage accumulators are usually made up of medium-voltage units, and these can then be charged either in series or in parallel, according to the rating of the charging plant. If small h.p. accumulators have to be charged only on rare occasions, an ordinary thermionic rectifying valve, or two or three connected in parallel, may be used. The charging current for h.p. batteries is best regulated with a high resistance, and a high-reading milliammeter.

Apart from the actual electrical charging, it is very important to keep the cells in good chemical condition. On no account should acid be allowed to come into contact with brass terminals, and should this occur, the acid should be neutralised, and the terminals carefully washed and coated with vaseline. This is a most important point. The specific gravity of the acid should also be kept correct, and for this purpose a really accurate hydrometer should be used. Only best accumulator acid and distilled water should be employed, and a really good acid pump is certainly a necessity. There are, of course, many other accessories which are useful, such as apparatus for determining the leakage between adjacent celluloid cells by the manometer tube method. A really accurate low-reading voltmeter while, perhaps, not being a necessity, is an exceedingly useful adjunct to a well-equipped charging depôt.

Tramways and Light Railways Association.

The annual congress of the Association will be held at Bath next week. The chairman and directors of the Bath Electric Tramways, Ltd., will hold an informal reception on Wednesday evening, June 29th, and on Thursday, after a civic welcome by the Mayor, Alderman Cedric Chivers, J.P., and the Mayoress, Madame Sarah Grand, a paper on "Some Aspects of Local Passenger Traffic" by the late Mr. W. E. Hardy, M.B.E., managing director of the Bath Electric Tramways, will be read and discussed. Luncheon at the Grand Hotel will be given by the chairman and directors of the Bristol Tramways and Carriage Co., Ltd., and afterwards the members will visit Cheddar and Wells. On Friday the annual general meeting will be held, and a paper on "Modern Tramway Equipment" will be read by Mr. A. V. Mason, deputy general manager of the London group of tramway companies, and discussed. The members will be entertained at luncheon by the chairman and directors of the Bath Electric Tramways, Ltd., at the Guildhall. In the afternoon a visit will be paid to the Roman Baths and Pump Rooms, followed by a tour of the surrounding country. A reception at the Pump Rooms by the Mayor and Madame Sarah Grand, followed by an entertainment and dancing, brings the proceedings to a close.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

Our Trade Names Supplement.

The fifth of our Quarterly Supplements of Trade Names of electrical products accompanies the present number of the ELECTRICAL REVIEW.

A Travelling Exhibition.

The accompanying illustration shows how the Nelson Corporation Electricity Department camouflaged one of its vehicles upon the occasion of the Reedyford hospital gala and Lancashire fire brigade demonstration on June 11th. The skirting of the superstructure was illuminated with

A Gala Display by Nelson Electricity Department.

electrical slogans and the surrounding shelf bore examples of the usual domestic appliances. The display attracted a great deal of interested attention, and should result in more business for the Department.

Australian Demand for Increased Duty on Batteries.

Applications for increased import duties on electric batteries were made recently to the Australian Tariff Board. The Clyde Engineering Co. asked for the imposition of duties amounting approximately to 60 per cent. on British batteries and 72½ per cent. on others. The company's representative said that at present British batteries were imported at a price 15 per cent. lower than the Australian production cost. The annual requirement for motor-cars was about 60,000; if the duty was imposed his company would undertake to increase its plant, &c., within three months, to give an unlimited supply of batteries. Another company, On Masse Batteries, Ltd., promised to raise its production to 2,000 a week if duties of 47½ per cent. and 60 per cent. were imposed on British and other batteries. A representative of an American company said that Australian firms were assemblers rather than manufacturers, and he suggested a reduction in the present rates of duty. His company had abandoned the idea of erecting an Australian factory as the demand was not large enough to be remunerative.

Unemployment.

There was an increase of 104,187 in the number of registered unemployed during the week ended June 6th. At that date the total was 1,089,700, as compared with 985,513 on May 30th, and 1,609,119 on June 7th, 1926 (coal dispute period). The increase is attributed to the Whitsun holidays.

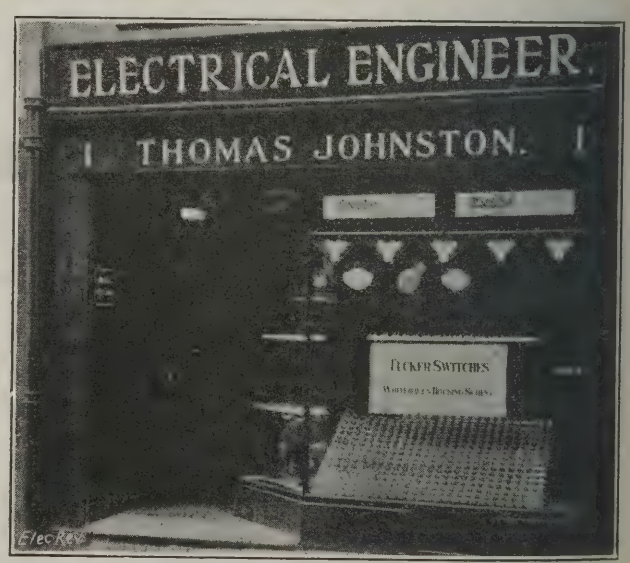
Radio Patents in Australia.

As we have already reported, large firms in Australia have challenged and have refused to pay the patent royalties charged by Amalgamated Wireless (Australasia), Ltd. *The Times* reports that before the Royal Commission on Wireless on June 15th, Mr. Fisk, the managing director, declared that the company had spent £200,000 on patents and research and had only received £76,000 from royalties.

The "Electrical Review" Index.

The Index to Vol. C. (for the half-year ending June 30th, 1927) will be published shortly, and we shall be glad to receive the names and addresses of those who require it (free of charge) for binding purposes, or wish to retain it for reference. Application should be made to the Publisher, 4, Ludgate Hill, E.C.

Employment during May.



According to this month's *Ministry of Labour Gazette* employment in the engineering industry during May was still slack on the whole, but continued to show improvement in all sections; in the motor vehicle and electrical sections it remained fairly good. The "overall" percentage of unemployment in the industry fell from 9.7 to 8.7. The proportion in electrical engineering decreased from 5.6 to 5.1 per cent. There was an increase in unemployment in the electrical wiring and contracting industry—from 7.4 to 9.1 per cent. In the electrical cable, wire and lamp manufacturing group there was a slight improvement, the unemployment figure falling from 7.7 to 7.4 per cent. The actual numbers of unemployed in the branches of industry mentioned were as follows:—Engineering, 87,444 (including electrical engineering, 3,919); electrical wiring and contracting, 1,260; and electric cable, wire and lamp manufacturing, 6,476.

Local Exhibition.

SOUTHAMPTON.—The Corporation Electricity Department is holding a special fortnight's display of "Magnet" domestic appliances (General Electric Co., Ltd.), at its showrooms. "Magnet" appliances also figure in the displays arranged by the local contractors for the occasion.

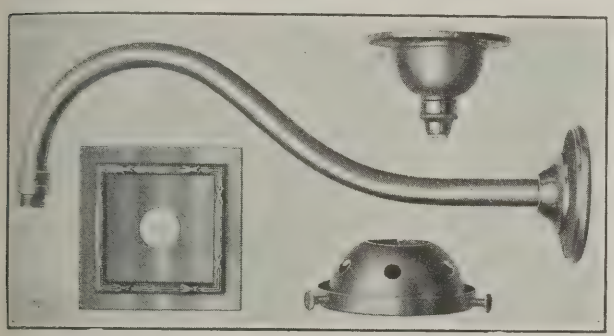
A Tucker Switch Display.

A very effective display of Messrs. J. H. TUCKER & Co.'s tumbler switches has been made by Mr. T. Johnston, of Whitehaven, who recently received a contract to wire 108 houses upon the Corporation's Bransty housing estate. Mr.

Tucker Switches at Whitehaven.

Johnston has decided to employ Tucker switches exclusively. A view of Mr. Johnston's shop window showing the batteries of Tucker switches which are being used in the houses appears herewith.

Increased Austrian Duty on Insulators.

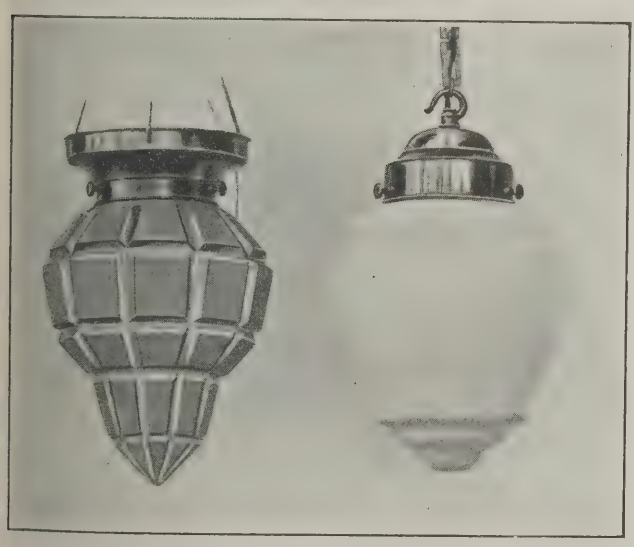


The Austrian Government proposes to increase the import duties on a number of articles, including shaped parts of insulating materials (except porcelain, glass and hard rubber) for electrical purposes, not equipped, weighing more than 600 gr. each. The proposal is to raise the rate from 25 to 60 gold kr. per 100 kg.

Electric Power in Industry.

Preliminary Report No. 15 upon the 1924 Census of Production was published with the *Board of Trade Journal* for June 16th. It shows that in the wall-paper trade there was 811 kW of generating plant, as compared with 850 kW in 1912. The aggregate capacity of installed electric motors was 1,678 h.p., and power for 1,683 h.p. of these was purchased. The capacity of the generating plant used by the fertiliser, glue, sheep dip and disinfectant trades rose from 870 kW in 1907 to 3,528 kW in 1924. There was a total of 23,606 h.p. of electric motors, power for 19,688 h.p. of which was purchased. There was a reduction in the capacity of generating plant installed in the starch, blue, and polish trades, from 970 kW in 1907 to 402 kW in 1924. The total electric motor horse-power was 11,922; power for 7,117 h.p. was purchased. There was 124 kW of plant in the packing trade, and 3,005 h.p. of electric motors (power for 2,982 h.p. purchased).

A Birmingham Fittings Factory.



One of the most up-to-date factories for the production of electrical fittings is the St. George's Works of MESSRS. JOHN LAWTON & SONS, LTD., Harford Street, Birmingham. The company's resources enable it to carry out all the processes from pressing and spinning to electro-plating and polishing.

Electrical Fittings by John Lawton & Sons, Ltd.

A very wide range of fittings is produced; for instance, the company makes 160 varieties of switch plates, 40 types of brackets, 90 ceiling plates, and 60 galleries. The first illustration depicts an example of each of these fittings.

Typical lighting fittings manufactured by the company are shown in the second illustration. The left-hand pattern is

Two Totally-enclosed Lighting Units.

a totally-enclosed fitting of moulded glass for ceiling mounting; the other is also of the totally-enclosed dustproof type but of opal glass. The latter is provided with a chain of rectangular links, through which the flexible is threaded.

Patent Restoration.

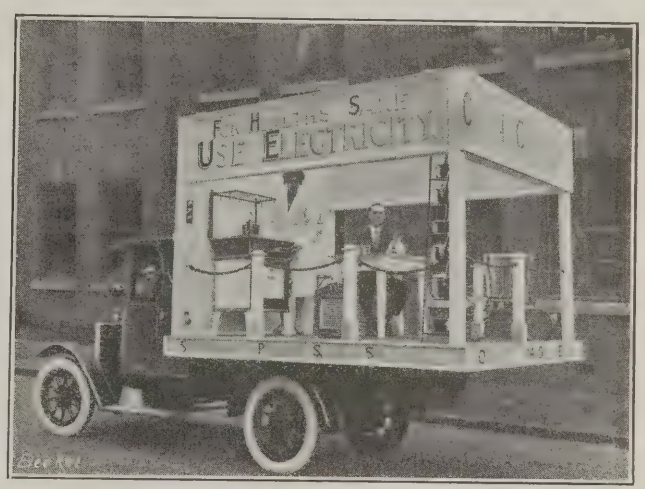
An order has been made restoring Patent No. 200,963 of 1922, granted to M. W. W. Mackie, for "Improvements in Dynamos and Motors."

The Department of Overseas Trade.

The Parliamentary Correspondent of the *Daily Telegraph* says that the agitation for the retention of the Department of Overseas Trade appears likely to be successful, and Members of Parliament who have interested themselves in the matter feel that the battle is as good as won. In the case of the other two Ministries under sentence of extinction—the Department of Mines and the Ministry of Transport—the Government will, it is stated, stand firmly by its decision.

The Timber Market.

Our timber trade correspondent reports that the demand for all house and general building timbers, as well as for pine and spruce poles, continues to be well maintained. Stocks of such woods at docks, prior to the opening of navigation, had declined considerably in volume; the new arrivals, however, will soon bring them up once more to the general average of the past six years, although the better demand should not make stocks unwieldy throughout the summer. The hardwood market, although showing a lack of activity, is firm, as with the exception of American supplies, stocks are from low to moderate. With the expected decline in receipts from the United States, however, in consequence of the floods in the Mississippi Valley, the hardwood market is likely to show still further firmness.



Wages in the Engineering Industry.

The unions concerned in the negotiations for increased wages in the engineering industry have issued ballot papers to their members for voting upon the employers' offer of 2s. per week increase to plain time workers. The executives of the unions are leaving the matter solely in the hands of their members, making no recommendation for either acceptance or rejection. A bare majority will be sufficient to carry the proposal and the papers are to be returned by July 20th.

A meeting of the London Joint Engineering Trades Committee was to be held this week to consider the situation.

Electricity in a Birmingham Carnival.

On June 11th a flag day and carnival were held in aid of the Birmingham hospitals and the City Electric Supply Department took advantage of the opportunity to make a display of domestic appliances. This was mounted on a lorry, as shown in our illustration, and comprised a cooker, geyser, wash-

Display by the Birmingham Electric Supply Department.

boiler, radiators, kettle, iron, toaster, coffee percolator, fan and lighting fittings. The superstructure was inscribed with electrical slogans.

Southend Traders and Municipal Showrooms.

The Southend, Westcliff, and District Chamber of Trade has sent a letter to the Town Clerk suggesting that if electricity showrooms are erected they should not be used as sale rooms, as electrical traders of the borough had satisfactorily supplied past demands for electrical fittings and appliances, and also for the wiring of houses, &c.

Trade Announcements.

Mr. H. WORTON, of Trinity Square, Nottingham, has opened a branch of his electrical business at the Crescent, Spalding.

The PARSONS OIL ENGINE CO., LTD., has opened an office at 3, Victoria Street, S.W.1 (telephone: Victoria 2525). This office will be in charge of Mr. C. Wright.

Mr. GEORGE D. JONES, electrical engineer, late of F. J. Jones and Sons, of The Eastgate, Chester, announces that he is continuing to carry on business at 6, Seller Street, in the city.

Mr. J. H. MOORES, who has represented the Igranic Electric Co., Ltd., for some years in the North-Western counties, has joined the staff of Messrs. John Moores & Co., Ravald Street Works, Salford, manufacturers of insulating materials.

LIGHTING TRADES, LTD. (incorporating J. & W. B. SMITH, LTD.), has removed its offices to Oriel House, 30-31, Farringdon Street, E.C.4. The company's showrooms are nearing completion.

MESSRS. PARMITER, HOPE & SUGDEN, LTD., have appointed Mr. J. A. Anderson, 1, Eldon Square, Newcastle-upon-Tyne, as their sole representative for the North-East Coast district. He is handling the sales for this district of their Aeroflex h.p. and l.p. fuse-gear, and other products.

Messrs. J. MACGREGOR & CO. have removed to 4, Denmark Street, Charing Cross Road, W.C.2. 'Phone: "Gerrard 7302-7303."

D

New Catalogues and Lists.

The VISCO ENGINEERING CO., LTD., 162, Grosvenor Road, S.W.1.—A pamphlet advertising the "Visco" air filter for motor vehicles, &c.

The ELECTRICAL EQUIPMENT & CARBON CO., LTD., 109-111, New Oxford Street, W.C.1.—List No. S.C.9, giving details and prices of "Siemens" therapeutical carbons.

Also a monthly stock list of motors, generators, bell transformers, carbons, &c.

The RELIANCE TELEPHONE CO., LTD., Goschen Buildings, 12-13, Henrietta Street, W.C.2.—A cut-out advertising the company's intercommunication systems—installation and maintenance.

MESSRS. GENT & CO., LTD., Faraday Works, Leicester.—An illustrated and priced catalogue dealing with "Tangent" electromotor sirens for works, &c.

METRO-VICK SUPPLIES, LTD., Trafford Park, Manchester.—Folder No. 4140/4, advertising "Cosmos" fans; also a photograph of a window display for the use of dealers in these fans.

TURNER BROS. ASBESTOS CO., LTD., Rochdale.—A card advertising ebony "Sindanyo" insulating board for switch panels, &c.

The CRESSALL MANUFACTURING CO., LTD., 31 & 32, Tower Street, Birmingham.—Leaflet E.F.B.1927, illustrating and describing the "Cressall" electric fire bar. Priced.

AUTOMATIC & ELECTRIC FURNACES, LTD., 173-175, Farringdon Road, E.C.1.—Bulletin No. 38, "The Correct Hardening of Tool Steel," by A. R. Page, giving the results of experiments with a Wild-Barfield electric hardening furnace.

SHEFFIELD STEEL PRODUCTS, LTD., Templeborough Works, Sheffield.—A reprinted article upon the manufacture of files by the company.

SIEMENS-SCHUCKERT (GREAT BRITAIN), LTD., 109, Kingsway, W.C.2.—An illustrated pamphlet advertising the company's automatic intercommunication system.

MESSRS. J. G. STATTER & CO., Queen Anne's Chambers, Westminster, S.W.1.—Leaflets No. X203a, dealing with a.c. and d.c. circuit breakers for currents up to 1,000 A, and No. X225, describing ironclad circuit breakers (Home Office type). Illustrated and priced.

The IGRANIC ELECTRIC CO., LTD., 147, Queen Victoria Street, E.C.4.—An illustrated brochure dealing with the construction and operation of the company's seven-valve neutrosonic radio receiver. Particulars of accessories are also included.

W. T. HENLEY'S TELEGRAPH WORKS CO., LTD. (Engineering Department), Holborn Viaduct, E.C.1.—A small priced booklet advertising the company's plywood backboards. It has stiff covers forming a reproduction of one of the boards.

MESSRS. JAMES MCMILLAN & CO., Clun House, 17, Surrey Street, W.C.2.—A pamphlet describing "Pripp" electric lighting fixtures for sewing machines.

MESSRS. HOPKINSONS, LTD., Britannia Works, Huddersfield.—Three illustrated pamphlets dealing respectively with a steam isolating valve, the "Hopkinson-Ferranti" valve, and the "S.P.S." valve.

The PLAN CLIP CO., 4, St. Paul's Churchyard, E.C.4.—A booklet dealing with a system of filing drawings, blue prints, &c.

The BRITISH THOMSON-HOUSTON CO., LTD., Crown House, Aldwych, W.C.2.—An illustrated pamphlet containing full details and prices of a new series of 2-V valves. Also copies of the instruction sheets which are packed in the cartons.

Dissolution of Partnership.

POTTS & CO., electrical and mechanical engineers, Longton, Stoke-on-Trent.—Messrs. W. J. Potts, A. L. Vass, and D. Humpherson have dissolved partnership. Debts will be attended to by Mr. T. N. Elliott, District Bank Chambers, Longton, the receiver.

Bankruptcy Proceedings.

J. TURNER, 62, Blackburn Road, Great Harwood, Lancs., electrician.—The receiving order in this matter was made recently on debtor's own petition. The statement of affairs shows liabilities of £855, against net assets of £294. The first meeting of the creditors was held recently at the Official Receiver's office, Preston. The following are creditors:—

	£		£
Beardsall, E., & Co., Ltd.	31	General Electric Co., Ltd.	88
Beaten Metal Co.	26	W. T. Henley's Telegraph Works Co., Ltd.	45
Baxendale & Co., Ltd. ...	65	McGrath, J. & J.	44
British Insulated Cables, Ltd.	19	Northern Steel & Hardware Co., Ltd.	76
Crypto Electrical Co., Ltd.	48	Turner (Mrs.)	260
Palmer, Riley Co., Ltd.	28		

T. W. THOMAS, trading as T. W. Thomas & Co., electrical contractor, Clarendon Road, Middlesbrough, Yorks.—The public examination of this debtor was held recently at the Court House, Middlesbrough. Debtor's liabilities were put down at £916, against assets of £317, leaving a deficiency of £599. Debtor attributed his failure to bad debts and lack of capital. The examination was adjourned.

J. TURNER, 62, Blackburn Road, Great Harwood, Lancs., electrician.—The public examination of this debtor was held on June 15th at the County Court House, Blackburn. The statement of affairs showed liabilities of £856, against assets of £295. Debtor attributed his failure to the illness of h wife, heavy household expenses, keen competition, and insuf cient work. The examination was closed.

T. F. COLLIER, Union Street West, Oldham, electrician.—The adjourned public examination of this debtor was hel recently at the Court House, Oldham. The Official Receiv stated that the debtor had been asked to amend his statemer of affairs, but there was some difficulty with regard to i Debtor said he would be able to pay his creditors 20s. in th £, but he was told that he should enter all the items in th account and stipulate which were disputed. The examinatio was therefore adjourned.

J. STEPHENSON (J. Stephenson & Son), plumber and electr cian, 36 and 37, Flowergate, Whitby.—Trustee, Mr. M. W Chapman, Golden Lion Chambers, Whitby, appointe June 13th.

D. M. STRODE, engineer, 44 to 50, Osnaburgh Street, N.W and 6 and 7, Creed Lane, E.C.—Last day for proofs for div dend, June 30th. Trustee, Mr. E. H. Hawkins, 4, Charte house Square, E.C.

W. T. SMITH, electrical and mechanical engineer, 60, Hamp den Street, Bolton.—Last day for proofs for dividend July 2nd Trustee, Mr. J. G. Grant, Senior Official Receiver, Byron Street, Manchester.

G. S. HALL (G. S. Hall & Co.), electrical engineer, 55, Malde Road, New Malden, and late of 8, Malden Road.—Receivin order made June 15th, on a creditor's petition. First meeting June 28th, public examination July 29th, both at Carey Street W.C.

J. T. NICHOLS, 4, Glebe Road, Kingsland Road, Dalston, an Rye House, Highams Park, wireless parts merchant.—Receiv ing order made June 15th on a creditor's petition. First meet ing, June 27th, public examination, July 29th, both at Care Street, W.C.

J. SPAVEN, electrical and mechanical engineer, 51 and 53 George Street, Bradford.—Receiving order made June 15th, o debtor's own petition.

W. A. BARKER and F. G. H. BARKER (Barker Bros.), elec trical engineers, 554a, Dudley Road, Wolverhampton.—Receiv ing order made June 14th, on debtors' own petition.

H. A. SANDERS, electrical contractor, The Black Cat Restau rant, Chawston, Beds.—Last day for proofs for dividend June 24th. Trustee, Mr. H. Ball, Duke Street, Bedford.

C. HUBBARD, electrician, 13, Magdalen Street, Norwich.—Second and final dividend of 2s. 8d. in the £, payable a the Official Receiver's office, 9, Queen Street Chambers Norwich.

G. C. LAZENBY, wireless engineer, 29, Old Town Street Plymouth.—First meeting held June 21st, at 11, St. Aubyn Street, Devonport. Public examination, July 22nd, at the Western Law Courts, Guildhall, Plymouth.

G. J. C. THORNE and A. H. THORNE (Lawrence Electrica Trading Co.), electrical engineers, late of 159, High Street Notting Hill, W.8.—Trustee, Mr. D. Williams, Official Re ceiver, Carey Street, W.C., released June 9th.

Company Liquidations.

ELECTRICAL WHOLESALE SUPPLIES (LEICESTER), LTD., 58, Halford Street, Leicester.—A meeting of creditors was held recently at 25, Friar Lane, Leicester, when Mr. J. A. Hopps, the liquidator, submitted a statement of affairs which showed ranking liabilities of £1,929. The indebtedness to the trade was £1,028, and there were cash creditors for £901. The net assets were £398, leaving a deficiency of £1,531. Mr. Hopps reported that the company was registered on July 3rd, 1924, with a nominal capital of £3,000. The issued capital was £1,050, and those shares were allotted in equal proportions amongst Messrs. G. H. Gelsthorpe, T. Gelsthorpe, and J. T. Kemp, who had acted as directors. During the first year the turnover was £5,489, and there was a net loss of £97. In the following twelve months the turnover fell to £4,856, with a net loss of £602. Between July and December of last year the sales were only £1,167, and there was a loss of £925. During the present year there had been a further loss on the trading of £494. A resolution was passed confirming the voluntary liquidation of the company with Mr. Hopps as liquidator. The following are creditors:—

	£		£
Woolf, Arnold	30	Perfecta Seamless Tubes, Ltd.	96
Electric Cables, Ltd. ...	73	Standard Metals, Ltd....	64
Kemp, J. T., Ltd. ...	382	Smith, J. & W. B. ...	36
Midland Manufacturing Co.	22	Balkan Electric Co. ...	32
Armorduct Cable Co. ...	41	Pooley, H., & Son ...	21
L. Mitchells & Son ...	35	Hopps & Bankart ...	26

DE LEEUW & CO., LTD., Sentinel House, Southampton Row, W.C.2.—Under the compulsory winding up order made against this company last October, the report of Mr. J. Barwick Thompson, Official Receiver and liquidator, has been issued to the creditors and shareholders. The accounts lodged show liabilities of £2,269, against assets valued at £191, and a deficiency of £5,178 as regards contributions. The Official Receiver reports that the company was registered as a private company in April, 1925, with a nominal capital of £500, increased in January, 1926, to £10,000, and was formed to carry on business as general agents, dealers in radio appliances, electrical apparatus, &c. The company acquired Mr. Henry De Leeuw's in-

rest in certain agency agreements, the purchase price of £500 eing satisfied by the allotment of shares. The business was onfined principally to the sale of Freed-Eismann wireless sets id components. An agreement stated to have been entered ito with that company cannot be traced; Aldis (a director) ates that it was last in the possession of De Leeuw. In or out October, 1925, De Leeuw proceeded to America with ie object of obtaining confirmation of the agreement with ie Freed-Eismann Company. For this purpose, a sum of 200 was borrowed from a moneylender and subsequently paid. In March, 1926, De Leeuw obtained from another oneylender sums amounting to over £500 against cheques awn on the company's banking account. The directors state at this was done without their knowledge. White (a former rector) states that the moneys were used by De Leeuw to quire 500 preference shares of the company. Further moneys mounting to £200 were borrowed in April, 1926, from another oneylender who subsequently presented the petition upon hich the winding-up order was made. Both De Leeuw and hite signed the promissory note; Aldis denies any knowledge the transaction. Proceedings were commenced against the mpany and in July, 1926, judgment for £230 was obtained gainst the company, De Leeuw and White. Owing to the nsatisfactory financial position of the company which had en brought about by the transactions entered into by De eeuw, he was requested to resign. The board then instructed ie company's auditors to investigate the position and to epare accounts, and extreme difficulty had been experienced. appears, however, that the trading from the date of incor- ration to May 22nd, 1926, resulted in a net loss of £1,930. cluded in the accounts is a sum of £994, representing moneys awn from the company's funds by De Leeuw which he had t satisfactorily accounted for. De Leeuw has left the untry and is believed to be in Holland. The failure of the mpany is attributed by White to extravagance on the part De Leeuw and to heavy overhead charges. In the opinion the Official Receiver the failure is due to the moneylending ansactions entered into by De Leeuw, and to the depletion the company's funds by moneys received by him for which e has not accounted. The failure was contributed to by the nission of the other directors to exercise any control over e Leeuw.

Neutron, Ltd., Sentinel House, Southampton Row, W.C.—he report of Mr. J. Barwick Thompson, Official Receiver, on the liquidation of this company has been issued. The state- ent of affairs discloses total liabilities of £9,534 (unsecured 8,092); assets valued at £1,441; and a deficiency of £8,592 ith regard to contributories. The company was registered a private company in May, 1924, with a nominal capital £500, its objects being to carry on business as manufac- rers and buyers and sellers of substances used as crystal tectors, and in particular the crystal known as "Neutron." he company acquired the goodwill and assets of a business rried on by Bennison and De Vries. The consideration as fixed at £394, which was satisfied by the issue of fully- id shares. Bennison acquired 135 shares, and transferred em to W. Wolsey, a director, in July, 1926. Later, three bentures for £100 each were issued to Bennison for moneys leged to have been advanced by him. It appears that at ie date the debentures were issued the company owed ennison about £50 only, and later the company lent to m £350 and a further sum of £120. In March, 1926, Benni- n appointed a receiver and manager on his behalf, and acted as such until July, 1926. Wolsey states that shortly ter the incorporation of the company Bennison approached m as a partner of the firm of V. Zeitlin & Sons with a ew to obtaining financial assistance, and in the result an reement was entered into whereby Zeitlins were appointed le distributors for Great Britain and Ireland of "Neutron" ystals. There were agreements with other firms for dis- ibuting crystals, and the position with regard to these ill require the consideration of the liquidator. In April, 26, other debentures for £1,000 were created, and on the me date a debenture for £250 was issued to Fitton Smith id Co., Ltd., for cash. In May, 1926, it was reported at a ard meeting that Fitton Smiths had made further advances nounting to £915, and a debenture for £900 was issued. was also reported that Fitton Smiths had endorsed one the company's bills for £400 and had guaranteed a debt £633 due by the company, and a further debenture for ,000 was issued. Later, a further debenture for £400 was ued to Fitton Smiths in respect of an advance made by em, with the result that they held debentures talling £2,550. The company's borrowing powers were nited to the amount of its issued capital, and questions ose as to the validity of the debentures. An extraordinary eeting was held, at which a resolution was passed author- ng the directors to borrow to the extent of £5,000. At e same meeting it was resolved that debentures for £3,150 ould be issued to P. G. Marr & Co., Ltd. (the successors Fitton Smith & Co., Ltd.) in settlement of the moneys e to them in respect of the £2,550 debentures previously ued and other moneys advanced. As those debentures re issued within three months of the commencement of winding-up for a past consideration, they would appear be void. In November, 1926, the creditors were asked accept 3, 6, 9 and 12 months' bills in respect of their ims, but the proposals fell through. In these circum- nces Marrs declined to finance the company further. There were a number of judgments against the company, and in January last it was decided to put the company into voluntary liquidation. On the same date Bennison appointed a receiver on his behalf. At an extraordinary meeting a resolution for the appointment of Mr. M. D. Booth as voluntary liquidator was proposed, but was not carried, and on January 28th a creditor presented the petition upon which a winding-up order was made on February 15th, 1927. On February 17th, 1927, P. G. Marr & Co. appointed a receiver. At a later date the receiver on behalf of Bennison retired; the receiver appointed by P. G. Marr & Co. had not taken any action. The trading account shows that the net sales amounted to £68,588, and there was a gross profit of £16,828, which is carried to the deficiency account. Wolsey attributes the failure of the company to excessive advertising and to extravagant management. In Bennison's opinion the failure of the company is due to excessive advertising and insufficient working capital. He also states that the company kept a large and expensive staff and incurred losses in connection with wireless sets. The Court, on March 7th, appointed Mr. M. D. Booth, chartered accountant, of 40-43, Norfolk Street, Strand, London, W.C.2, liquidator of the company with a committee of inspection.

Yates & Thom, Ltd.—Winding up voluntarily. Liquidators, Mr. F. Thom and Mr. W. H. Davies, Canal Engineering Works, Blackburn. Meeting of creditors, July 1st, at Canal Engineering Works. Particulars of claims to the liquidators by August 2nd. (This notice is formal, all creditors have been, or will be, paid in full.)

Manda Motors, Ltd.—A meeting of members is called for July 18th, at the offices of Messrs. Fincham, Partridge & Co., 3, Warwick Court, Gray's Inn, W.C., to hear an account of the winding up from the liquidator, Mr. A. H. Partridge.

Alkum Electrics, Ltd.—Liquidator, Mr. T. W. Meldrum, Portland House, 73, Basinghall Street, E.C., released June 3rd.

Electrical Engineering & Equipment Co., Ltd.—A meeting of members is called for July 18th, at the office of Messrs. Deloitte, Plender, Griffiths & Co., 5, London Wall Buildings, E.C., to hear an account of the winding up from the liquidator, Mr. R. Kettle.

Private Arrangements.

A. E. Humphreys, 20, St. James' Square, S.W.1, electrical engineer and contractor.—A meeting of creditors was held on June 13th, when it was stated that the liabilities to creditors amounted to £2,640. The assets at cost figures were said to total £1,379. The debtor started business in November, 1925, with a capital of £250, borrowed from five persons; the whole amount was still owing. The sales and work done up to the current month had been £6,054. There was a gross profit of £457, and the office expenses had been £393. The drawings of Mr. Humphreys were £814 and the salaries had been over £5 weekly. The debtor had done considerable work at Thorne and Ashton-under-Lyne, and there was still work in hand. The debtor had been contracting for some time for fitting electrical apparatus in houses. Six or seven writs had been served on him, and a bankruptcy notice. The debtor had been working under contract for some time for the House Builders' Association, and the secretary of that concern said that the Association would continue to give the debtor contracts if he were allowed to carry on. No definite resolution was passed; the opinion was expressed that the matter should be dealt with privately. The following are creditors:—

	£		£
British Insulated Cables, Ltd.	148	Siemens Bros. & Co. ...	118
Tucker, J. H., & Co., Ltd.	27	Borman & Co., E. ...	144
Callender's Cable & Construction Co., Ltd. ...	137	Sharp & Fisher	25
Baxter & Caunter, Ltd.	41	General Electric Co., Ltd.	120
Electrical Conduits, Ltd.	132	White, W., & Co.	343
Siemens Electrical Works	458	Young & Wildsmith ...	37
		Wandsworth, E.	28
		Imperial Lighting Co. ...	47

Deeds of Assignment.

B. Wilson, wireless engineer, 261, Hornsey Road, N., Ivy Place, Swansea, and 59, East Street, Leicester.—Last day for proofs for dividend, July 31st. Trustee, Mr. G. E. Rolt, 28, Watling Street, E.C.

R. G. Cronyn (Radio Sets and Supplies Co.), 3, King Street, Maidenhead.—Particulars of claims by June 24th, to the Trustees, Mr. W. J. Osborne, Balfour House, Finsbury Pavement, E.C., and Mr. C. Latham, 78, New Oxford Street, W.C.

Recent Contracts.

Messrs. Worthington Simpson, Ltd., have secured a contract for the supply of one 9-in. single-stage high-lift centrifugal pump, capable of delivering 2,000,000 gallons of water per day, against a head of 170 ft., for the Reading Water Works. This pump will run at a speed of 1,500 r.p.m., and will be driven by a 140-b.h.p. Crompton protected type auto-synchronous motor, and is a duplicate of a set previously supplied. These electrically-driven pumps replace the steam pumping plant consisting of a high duty Worthington engine supplied in 1900, and mark the conversion of the Bath Road pumping station into an electrically-driven one. The steam installation is to be retained for stand-by duty.

An important contract covering the main switchgear and a considerable amount of auxiliary apparatus for extensions to the Portobello station of the Edinburgh

Corporation has been placed with the METROPOLITAN-VICKERS ELECTRICAL CO., LTD. The equipment includes a 9-panel extension to the existing main 6,600-V switchgear, a 13-panel, 400-V station service board, and four 15-panel switchboards for the boiler house, together with a 230-V power-station battery and extensions to the station telegraph system. The extension to the main switchgear will include eight 6,600-V metal-clad oil circuit-breakers which, the company states, will be larger than any of this type yet constructed. The circuit-breakers are a development of the "Metro-Vick" "K" type gear, metal-clad and compound-filled, each unit having a rupturing capacity of 1,500,000 kVA. Each circuit-breaker will weigh approximately 11 tons, and each complete unit with its bus-bars, selector switches, and isolating switches, will weigh about 20 tons. A complete system of interlocks is provided to prevent incorrect operation and accident. The circuit-breakers, bus-bar selector switches, and feeder isolating switches, will be electrically operated. By this means the complete control of all switching operations is placed in the hands of one operator.

The METROPOLITAN-VICKERS Co. has also received an order for an electric winder equipment, arranged for double drum operation, for installation at the Choppington Collieries. The winder will be of the a.c. geared type, with a motor of 100-260 h.p., operating at 450 r.p.m. The drive will be transmitted through a double helical reduction gear, giving a speed of 36.55 r.p.m. on two cylindrical drums, each of 7 ft. diameter. One drum will be keyed to the shaft while the other is driven through a clutch, whereby the relative drum positions may be adjusted to allow drawing from different levels without loss of time and output. The maximum depth to be worked is 660 ft., and the winder is to deal with a net load of 1 ton, giving an output of 45 tons per hour. The equipment will include a "Metro-Vick" liquid controller with automatic accelerating gear, and pillar type switchgear with an electrically-operated contactor type reversing switch. A Lilly overwind and overspeed device will be fitted. The mechanical parts are to be supplied by Messrs. John Wood & Sons, Ltd.

Unemployment in Germany.

The Berlin correspondent of *The Times* states that the German unemployment returns for the second half of May show a further decrease in the number of persons in receipt of relief. On June 1st, the number was 649,000, as against 746,000 on May 15th. During the whole of May the number decreased by about 221,000. This does not include the figures for emergency relief, which are published monthly and have of late been in the neighbourhood of 220,000.

Book Notices.

"Four-Place Mathematical Tables with Forced Decimals." By F. S. Carey, M.A., and S. F. Grace, M.Sc. London: Messrs. Longmans, Green & Co., Ltd. Price, 1s. net.—This book contains the usual tables covering the field of practical mathematics, but the tables have been devised to secure greater accuracy in the fourth figure of the values of the functions set out. It is believed that the errors in the values given after interpolation rarely exceed unity. This result is brought about by means of forced decimals and improved devices for interpolation. The forced decimals are indicated by the type in which the decimals and differences are printed, according to whether the approximation given is in excess of the true value or otherwise.

Social Events.

The Elliott Social Association (Elliott Bros. (London), Ltd.), held its annual sports meeting and garden fête on June 11th. The representatives of the company included Sir Keith and Lady Elphinstone, Mr. W. O. Smith, Mr. and Mrs. L. W. Smith, Mr. and Mrs. A. W. Atkyns, and Mr. and Mrs. R. O. Smith. A very varied programme of sports was successfully carried out and there were numerous side shows. Lady Elphinstone presented the prizes. Music was provided by the Greenwich British Legion Band, and there was dancing until a late hour under the direction of Mr. P. R. Harriss.

The Power Contracts (Batwin) Sports Club, Football Section, held its annual dinner on June 11th, at the Imperial Hotel. After speeches by Messrs. T. H. Windibank, E. H. Bates and R. O. Clark, a very entertaining musical programme was provided.

The fifth annual sports and gala of the Siemens Sports Club took place on Saturday last, at the club's sports ground, Park Lane, Charlton. In spite of the somewhat showery weather, the affair was well attended, and capital sport was witnessed. Much amusement was caused by the humorous items, which included dribbling the football, egg and spoon race, three-legged race, tilting the bucket, cigarette race, &c. Child... were specially catered for in the amusement fair in anot... part of the ground. Credit is due to the organising comm... tee for the way in which the various items were run ... without hitch or unpunctuality. The proceedings w... enlivened by an excellent programme of music rendered ... Callender's Cable Works Band. The prizes were distribut... by General Sir H. de la Poer Gough.

The Oil, Chemical and Colour Exhibition.

An International Oil, Chemical and Colour Trades Exhibiti... was held at the Royal Agricultural Hall, London, N., fr... June 11th to 18th. There were few exhibits of an electri... nature, apart from motor-operated colour grinders and mix... and kindred machinery. International Combustion, Lt... extended the scope of the grinding machinery class by showi... coal pulverisers, the principal object in the display being ... "Raymond" mill. In addition the company showed ... example of the "Hum-mer" electrically-operated jiggi... screen, which is intended mainly for coal. A screen of anoth... pattern, the Sturtevant "Vibro-moto," was exhibited ... Messrs. Stevens & Manning. Pulverised fuel equipment w... also shown by the Buell Combustion Co., Ltd.; this consist... of two- and three-stage "W.A.C." pulverisers, a "Kek" ce... trifugal grinding mill, and samples of burners. Oil engin... appeared on the stands of Blackstone & Co., Ltd., a... Tangyes, Ltd. Among the latter's exhibits was a 19-b.h.... cold-starting engine driving a generator for the lighting ... the stand. Several examples of their rotary air compresso... driven by incorporated motors were shown by Messrs. Berna... Holland & Co. The chief exhibit was an 800 cu. ft. per minu... set for working at pressures up to 60 lb. per sq. in. Moto... formed an integral part of some of the mixers shown ... Messrs. Joseph Foster & Sons.

For Sale.

The clerk and steward, Prestwich County Mental Hospit... invites offers for surplus generating plant, motors, &... Messrs. Fuller, Horsey, Sons & Cassell will sell by auctio... on July 14th, at the Baltic Exchange, E.C., electrical pow... plant, &c. (See our advertisement pages to-day.)

Prices of Materials.

In their report on the lead market, Messrs. James Forst... and Co. state under date June 18th:—"Little change ... apparent in the general position of the metal. Consumers ... this country, in view of the renewed decline in prices, a... buying as little as possible. On the other hand, arrivals a... quite moderate, largely due to the better demand on the Co... tinent, and, apart from warehouse stocks, there is little prom... lead available. . . . As far as the near future is concerne... supplies are likely to be on the short side." Board of Trad... returns for May, 1927, indicate:—Imports 21,573 tons, expor... 1,446 tons, leaving for home absorption 20,127 tons.

Messrs. F. Smith & Co. report, June 21st: Copper (ele... trolytic) bars, £60 2s. 6d., 2s. 6d. dec.; ditto ditto sheet ... no change; ditto ditto wire rods, £70 2s. 6d., 2s. 6d. dec ... ditto ditto h.c. wire, no change.

Lighting and Power Notes.

Arbroath.—STREET LIGHTING.—The Arbroath Electric Ligh... and Power Co., Ltd., has renewed the contract with the Tow... Council for street lighting at the present charge of £15 10s... per lamp per annum.

Belgian Congo.—ELECTRICAL DEVELOPMENT.—Plans hav... been drawn up for the establishment of a 10,000-h.p. plant b... the Société Minière Kilo-Moto to utilise the water power o... the River N'Zoro in the Belgian Congo. The energy generate... would be used to operate the dredges used for gathering th... gold-containing gravel at the bottom of the River Kibali, an... for the treatment of the gold quartz at the Moto mines.

Bethesda (North Wales).—INAUGURATION OF ELECTRICIT... SUPPLY.—An electricity supply for the district was commence... recently. The scheme has been carried out by the Pirelli ... General Cable Works, Ltd., at a cost of over £7,000. Th... plant has a capacity of 100 kW, but the maximum load a... present is 60 kW. Next winter 148 street lamps will be pu... into commission. Mr. H. Owen, Bethesda, was the consultin... engineer.

Bradford.—INSTITUTION SUPPLY.—The Corporation Healt... Committee has approved the recommendation by the city ... electrical engineer (Mr. T. Roles) for the provision of a new ... high-speed engine and generator, complete with foundations ... steam piping, switchgear, &c., at a total estimated cost o... £1,650, at the Grassington Sanatorium, and has authorised ... application for sanction to borrow the necessary sum.

ELECTRICITY EXTENSIONS.—The Corporation Electricity Com... mittee has prepared a scheme for the provision of a sub-

tation for the Low Wells district and the laying of distributing mains at a cost of £7,538. The Committee has voted sum of £20,000 for mains extensions.

Burton-on-Trent.—Year's Working.—The accounts of the Corporation electricity undertaking (manager and engineer, Mr. T. Hall) for the year ended March 31st last, record a total income of £102,700, as compared with £94,937 in 1925-26. Owing to the higher cost of coal, working expenses increased from £46,498 to £62,611, leaving a gross profit of £40,089 (£48,439), to which were added rents from Wetmore Road cottages, making a total of £40,337 available. Capital charges, &c., absorbed £35,747, leaving a net surplus of £4,590, of which £2,000 was transferred to the district fund, and the remainder to the renewals fund. The previous year's working resulted in a surplus of £15,153. The capital expenditure during the year amounted to £61,868, bringing the total up to £569,748. The sales of electrical energy increased from 15,628,445 to 15,729,071 kWh, and the average price obtained per kWh from 1.42d. to 1.52d. The energy sold for power purposes fell by 4.16 per cent., but this was counterbalanced by an increase in the cooking and heating supplies of 52 per cent. The maximum supply demand rose from 5,500 to 7,750 kW.

Colne.—Year's Working.—The total income of the Corporation Electricity Department during the past year was £39,434, an increase of £4,447. The increase in electricity sold was 249,064 kWh, or 7.85 per cent. The ratio of working costs to net revenue was 64 per cent., solely due to the coal dispute.

Continental.—Italy.—The Rome correspondent of the *Financial News* reports that the recent loan issued in the New York market by the Società Elettrica dell' Isarco, amounting to $5,000,000, is to be used for the completion of the electric plant at Cardano, on the Isarco river, near Bolzano. The plant is expected to be completed by 1929 and will have an annual output of 500,000,000 kWh.

Switzerland.—What will be the largest hydro-electric undertaking in Switzerland is at present in course of construction by the Oberhasli Kraftwerken Gesellschaft. The scheme provides for the establishment of three plants at Handeck Boden and Innertkirchen to utilise the water power of the Upper Aare river. The preliminary work at the largest plant, that at Handeck, is so far advanced that orders for the electrical machinery have been placed. When complete this station will comprise four vertical-spindle generators, each with a capacity of 28,000-32,000 kVA, supplying at 11,000 V at 500 r.p.m. At present only two are to be installed by the Oerlikon Maschinenfabrik, these being the largest units so far adopted in the country. The weight of the rotors without turbine wheel will, it is stated, be 68 tons, and of the complete generator 165 tons. It is expected that the new alternators will be ready for their tests by May of next year.

Cumberland.—Electricity Supply.—Application is to be made by the Allerdale Coal Co., of Workington, for an Order to supply electricity to Maryport, Arlecdon, Aspatria, Harrington, Frizington, and other parts of West Cumberland. The company proposes to utilise coke oven gas for the generation of electricity.

Dorchester.—Increased Charges.—The Corporation Electricity Committee has recommended an increase of charges of ½d. per kWh.

Dundee.—Electricity Supply.—Mr. D. H. Bishop, Corporation electrical engineer, in a report, explains the city's position under the Central Scotland Electricity Scheme. Irrespective of the existence of the Central Board, Mr. Bishop points out, it would have been, and still is, necessary to add further boilers, auxiliaries, coal handling plant, &c., at Carolina Port in order to meet increasing demands, and to obtain the full output of the present turbo-generating plant. If the Corporation were to be allowed to develop individually, in the absence of the scheme, it would soon be necessary to consider the installation of another large turbo-alternator of about 15,000 kW. The maximum load which could be safely carried on the four small generators at Carolina Port is about 22,000 kW, supposing that the large generator was out of commission. If the rate of increase during the last few years were taken as a guide for the future, this load would be attained in the winter of 1928-29, so a new generator should normally have been ready for the winter of 1929-30. As the scheme does not contemplate connecting up Dundee till 1930-31, it appears that, unless fresh turbine plant is allowed to be installed before then, considerable risks will have to be run.

East Elloe.—Electricity Supply.—The Rural District Council has given permission to the Boston and District Electric Supply Co., Ltd., to supply electricity throughout this area. The company has agreed to do so subject to the Sutton Bridge and Long Sutton Councils allowing it to supply their districts.

East Ham.—Loan Sanctioned.—The Corporation Electricity Committee has received sanction to the borrowing of £9,000 for mains extensions, switchgear, and plant.

East Kent.—Inquiry.—An inquiry was held at Deal on June 16th by Sir W. F. Marwood relative to the proposal of the South-East Kent Electric Power Co., Ltd., to use overhead lines for the supply of electricity to Deal, Walmer, Sandgate, and Eastry. The company will take a bulk supply from Betteshanger Colliery, and on its behalf it was stated that the route for the overhead cable had been selected to avoid houses, trees, and other obstructions, and to interfere as little as possible with the normal course of agriculture. The cost of the overhead lines (5½ miles) would be £12,000, and if underground lines had to be used the cost would be increased to £24,000. The principal objections by those concerned near Sandgate were interference with cultivating arable and market garden land by poles, and the alleged inadequacy of the compensation offered.

Glasgow.—Refuse Disposal Plant.—The engineer and manager of the Electricity Department, in a report to the Corporation Cleansing Committee, states that in connection with the generator house at the new refuse disposal works he has noted that no special provision appears to have been made regarding a 3-phase, 440-V, 50-period supply to the charging plant to be installed in the garage to be attached to the new works; that the two 500-kVA transformers at present arranged for and intended for the operation of the various motors used throughout the works would no doubt be able to supply the 300 kW required for charging purposes, but that this would leave a somewhat inadequate margin for emergency. In order that adequate provision may be made to meet the garage requirements, he suggests that either two 750-kVA transformers be substituted for the two 500-kVA transformers provided for by the contract, at an estimated additional cost of £600, or that one additional 500-kVA transformer, with switchboard, &c., be installed, at a cost of £1,000. The special sub-committee, having had submitted to it a letter from Messrs. Heenan & Froude, Ltd., stating that the two 500-kVA transformers have now been completed and cannot be altered, has agreed to recommend that no alteration be made in the existing arrangement.

Hastings.—Loan.—The Town Council has applied for sanction to a loan of £53,389 for additional plant at the Broomgrove power station, *viz.*: Turbo-alternator, £22,675; boiler and economiser, £14,000; cooling tower tank, £2,550; two cooling towers, £3,190; pipe work, £5,962; instruments and sundries, £550; cables, £1,620; contingencies, £2,542.

Huntly (Aberdeenshire).—Electricity Scheme.—The Town Council is considering a scheme for the introduction of electricity into the burgh. The maximum h.p. available will be 250, and the estimated cost is between £16,000 and £17,000.

Inverness.—Electricity Supply.—In reply to critics of the Town Council's action in taking over the electricity undertaking at a cost of £80,000, Provost MacEwen at the last meeting stated although the accounts had not been adjusted he understood that the gross profit on the undertaking for the period of ten months was over £12,000. The net profit, after charging interest and sinking fund, was over £7,000.

Supply to Railway Company.—A request from the L.M.S. Railway Company for a reduction in the rate for the electricity supplied was considered. The company pointed out that the rate of 3d. per kWh which it was charged for power was higher than anywhere else, and that if the Council could meet the company in the matter, it would be prepared to install new plant at its works at Inverness and would probably use an additional average consumption of 100,000 kWh per annum. It was agreed that the company be offered a rate of 1½d. per kWh.

Japan.—Electrical Developments.—It is understood that the Tokyo Dento K.K. has decided to extend its Senju power station to a capacity of 75,000 kW by the end of 1928.

The Korean Hydro-Electric Co. has decided to buy generators from the Siemens and water turbines from the Voigt companies for its first power station. The water turbines will be of 32,000 kW.

It is reported that the railway authorities have decided to commence the construction of the Shinano-Gawa hydro-electric power stations this fiscal year, for which land will be purchased and a light railway will be built.

London.—Islington.—The Electricity Committee has received sanction to borrow £72,000 to cover expenditure incurred and estimated to be incurred in respect of distributing works during the period from April, 1926, to March, 1929.

Lowestoft.—Electricity in Bulk.—At a recent meeting of the Corporation Electricity Committee, the Town Clerk submitted a report of an interview with the Electricity Commissioners on the question of the draft agreement for the bulk supply of electricity by the Great Yarmouth Corporation to the Lowestoft Corporation. Lowestoft's contention that the agreement should place upon the Yarmouth Corporation the obligation to provide any plant necessary to enable it to meet future requirements was upheld by the Commissioners. They had been unable to agree upon the terms of the clause providing for a sliding scale in the "unit" charge for electricity based upon the cost of coal to the Yarmouth Corporation. Lowestoft also submitted that the minimum annual payment of £12,000 was excessive, and it was agreed that for the first full year of operation the minimum charge should be £9,490, £11,000 for the second year, and that the minimum charge of £12,000 should be made after that period. The Yarmouth Corporation objected to a penalty clause which Lowestoft had inserted in the draft agreement, but the Commissioners agreed that Lowestoft was entitled to have such a clause. Yarmouth also took exception to the insertion in the agreement of a

clause removing all possible doubt as to whether Lowestoft should be entitled as authorised undertakers to demand or take a supply of electricity from the Central Electricity Board under the terms of the Electricity (Supply) Act, 1926, if and when such supply became available. On this point the Commissioners will settle a clause for insertion in the agreement. The Commissioners reserved their decision regarding other minor points. The Electricity Committee has reported that as it will not be possible to procure a bulk supply of electricity from Yarmouth during the coming winter months, arrangements have been made with Messrs. John Chambers, Ltd., for the use of the firm's generating station at Oulton Broad in order to augment the output from the Council's electricity works. The Committee is entering into an agreement with them for the use of this plant from September 30th, 1927, to April 30th, 1928, and for such further period as it may be required in consideration of payment of £300 per annum.

Lymington.—Electricity Charges.—In reply to a communication from the Electricity Commissioners, the Rural District Council has decided to acquiesce in an application of the Town Council for an Order reducing the price of electricity from 1s. to 10d. per kWh as from June 30th next. The Lymington Electric Light & Power Co., Ltd., has intimated that it will not oppose such an Order.

Manchester.—New Plant.—The Corporation Electricity Committee has voted the following estimates:—Generating stations, land, buildings, machinery, &c., £308,400; distributing stations, transforming stations, and High Street stores, land, buildings, machinery, &c., £44,600; mains and services, £349,000; motors, cookers, and meters, £44,000; street lighting, £6,000.

Northern Ireland.—Lisburn (Co. Antrim).—From a statement made at a recent meeting of the Urban District Council it would appear that the proposed scheme by a private company to supply the town with electricity is being held up, owing to the Electricity Commissioners objecting to the clauses giving the Council the right to acquire the undertaking at any time after the end of ten years, and compelling the company to pay to the Council a "royalty" of ¼d. on every kWh sold within the district at a price exceeding 2½d. The Commissioners are not prepared to approve the agreement until both clauses are excluded.

Oxford.—Proposed Purchase of Undertaking.—The Town Council has decided to obtain counsel's advice as to the legal position in respect of the purchase of the undertaking of the Oxford Electric Co., Ltd.

Paisley.—Electricity Supply.—The Town Council has decided to undertake the wiring and lighting of the common stairs, passages and private courts in all suitable properties by electricity at a charge of £1 per lamp per annum. The public lighting of the whole town is now provided entirely by electricity, special distributing cables having been laid in every street. It is intended to lay a service cable from the street lighting cables to each block of tenement houses and to feed the common stair lights for the whole block from one service. All the stair lights as well as the street lighting will thus be controlled at the power station. It is expected that the scheme will be completed within two years.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Richmond (Surrey).—Reductions ranging from ¼d. per kWh in the case of small consumers.

Bedworth.—Lighting: From 7d. to 6d. per kWh.

Shipley.—Inauguration of New Plant.—The inauguration ceremony in connection with the change over from local generation to a 33,000-V supply from the Yorkshire Electric Power Co., which takes place at the Council's electricity works on June 30th, will be performed by Sir Andrew Duncan, chairman of the Central Electricity Board, in the presence of a gathering including representatives of all the principal electricity undertakings of West Yorkshire. Shipley is the first town in this area to effect this change over.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the Urban District Council of New Hunstanton, authorising it to supply in the urban district and the parish of Hunstanton, Mr. F. H. Grace to supply in the parishes of Thornbury, Olveston, and Alveston, and the Lichfield Corporation to supply in certain parishes in the rural district of Lichfield.

The Cannock Chase Colliery Co., Ltd., has applied for an Order to make provision for the transfer to the company of the undertaking authorised by the Chasetown and District Electricity Special Order, 1924.

Swansea.—Electricity Extensions.—The Corporation Electricity Committee has considered a comprehensive mains scheme prepared by the borough electrical engineer for the St. Thomas area, and has instructed him to carry it out at a cost of about £11,500.

The Committee has also instructed the electrical engineer to carry out the necessary works in connection with the laying of the following e.h.p. mains, &c.: E.h.p. main, &c., from Winch Wen sub-station to Llansamlet colliery (£4,357); e.h.p. loop into Maesteg sub-station from G.W. Railway, one main for alternate feed to Maesteg or G.W. Railway (£475 disconnecting tee pillar at Wychtree Bridge for junction Morriston, Llansamlet, copper pit brickworks, &c. (£250).

Uttoxeter.—Electricity Scheme.—The report of M. W. C. C. Hawtayne, of London, who was consulted by th Urban District Council with reference to the provision an electricity supply for the town, has been received. Th Council has decided to apply for an Order authorising it t develop a scheme and lay distributing mains throughou the town. A supply of electricity in bulk will be obtaine from Burton-on-Trent. The estimated cost of the scheme i £16,650 for the first year, rising to £22,500 in the third yea and it is anticipated that a supply will be available in abou a year's time.

Watford.—Loans.—The Corporation Electricity Committe has received sanction to a loan of £50,000 for mains an services.

Application is to be made for sanction to the borrowing o £2,000 for mains and sub-station kiosks in connection wit the supply of electricity to Bourne End, and £1,000 for publi lighting at Garston.

Tramway and Railway Notes.

Bradford.—Loans Sanctioned.—The Ministry of Transpor has sanctioned the borrowing by the City Council of £2,50 for purposes of the railless trolley vehicle undertaking i respect of the cost of additional overhead equipment for through service between Oakenshaw and the centre of Brad ford. Sanction has also been received to the borrowing of sum not exceeding £17,020 for the provision of 12 motor omnibuses for the Tramway Department.

Colne.—Year's Working.—The revenue from the Corpora tion tramway undertaking during the past year was £23,971 a decrease of £818, due to the replacement of the Laneshaw bridge cars by motor-omnibuses, and to loss of revenue during the general strike. The receipts per car-mile were 23.09d., an increase of 1.5d.

Continental.—Poland.—A special commission appointed by the Polish Minister of Communications has inspected the construction work on the Warsaw-Grodzisk suburban electric railway line. The line will probably be ready for use towards the end of September; it will greatly relieve the Warsaw-Vienna line and improve direct communications.—*Reuter's Trade Service* (Warsaw).

Huddersfield.—New Depot.—The Tramways Committee has recommended the erection of a large new depôt for the department's motor-'buses to hold 64 vehicles.

India.—Railway Electrification.—A comprehensive scheme for the electrification of the suburban service on the Eastern Bengal Railway has been drawn up and submitted to the Railway Board. The details of the scheme are not yet available. After the approval of the Railway Board, the scheme will have to be approved and sanctioned by the Secretary of State and thereafter be placed before the Railway Finance Committee of the Legislative Assembly and ultimately before the Indian Legislature.

The North-Western Railway's programme for electrifying its stations is making rapid progress. The work at Ferozepore and Multan will be completed within the next two months. At Peshawar and Bhatinda, work on the generating plant will be started soon, while estimates have been sanctioned for the electrification of Lyallpur, Sukkur, and Rohri.

Liverpool.—Overhead Railway.—The Liverpool Overhead Railway Co. changed over to the Corporation power supply on June 19th and closed down its own generating station. Electricity is being supplied at 520 V d.c. from three of the Corporation's sub-stations.

London.—Proposed New Route.—The *Daily Telegraph* reports that a proposal by the L.C.C. to construct a new tramway route to the Crystal Palace—which originated as far back as 1898 when a company proposed to build a light railway—has reached another stage. The Camberwell Borough Council has been asked by the Finance Committee to veto the L.C.C.'s proposal. The L.C.C. asked whether, in the event of its deciding to seek Parliamentary powers in respect of the construction of tramways from West Norwood to the Palace, the Borough Council would be prepared to consent to any of certain alternative routes being used. Six points are tabulated by the Camberwell Finance Committee against the scheme. These include the suggestion that there is no necessity for a tramway route inasmuch as better methods are now available, and it is questionable whether the route would be remunerative. The addition of tramways, it states, would add to the congestion of the roads, and the proposed route is also unsatisfactory.

Telegraph and Telephone Notes.

Argentina.—POST OFFICE AND TELEGRAPHY.—The primary object of the Executive Power during the past year has been to obtain the perfect operation of the Postal and Telegraph services. This important public service has been carried on regularly notwithstanding its extraordinary growth and the shortage of *personnel*, each day more apparent. On July 12th last was inaugurated the Library and Museum of Posts and Telegraphs, as also the Philatelic Section as a part of the same. An arrangement made with the Union Telephone Company, in the Federal Capital, and the Telephone Company in Tucumán, has enabled the Executive Power to endow both localities with the service known as "telephonegrams." During the year 1926 there was a great increase in the movement of internal postal and telegraphic drafts amounting to 2,176,499 items for a total of $78,601,612.63 m/n. and in that of telegraphic orders 137,944 items for a sum of $9,026,132.43 m/n. The total of declared values received was 413,844 items for a sum of $57,958,382.06 m/n., the dispatches being 472,193 for $64,974,290.49 m/n. The telegraph lines on December 31st last amounted to 44,248 kilometres in extent and to 114,318 kilometres of development.—*Financial Times.*

Sweden.—LONG-DISTANCE TELEPHONE.—Telephone communication between Stockholm and Paris was opened on June 16th and worked excellently. There were only eleven conversations.—*Reuter's Trade Service* (Stockholm).

A preliminary service was also made available between Stockholm and London on June 22nd daily from 3 p.m. to 8 a.m., with a reduced call fee at night.

The Telephone Service.—NEW EXCHANGES.—New central battery exchanges at Dudley Hill and Low Moor are to be followed shortly by one at Idle, where the site has been secured at The Grove.

The new automatic telephone exchange at Halifax was inaugurated on June 18th, the change-over from the old exchange being made at 2 p.m.

United States.—TELEPHONE DEVELOPMENT.—The *Daily Telegraph* reports that of the total number of telephones in the United States nearly two-thirds, or, in round figures, 11,400,000, are in domestic use, and serve about 10,700,000 families. In England, where approximately 1,500,000 telephones are in use, only one-third, or 500,000, are "family 'phones."

Radio Notes.

Australia.—PROPOSED NEW STATIONS.—Some time ago a sub-committee was appointed by the New South Wales Cabinet to inquire into a proposal for the erection of a Government super-power wireless station near Sydney and six relay broadcasting stations in country areas. It is said that the sub-committee's report is favourable to the scheme, which is receiving Cabinet consideration.—*Reuter's Trade Service* (Sydney).

Greece.—NEW MARKET.—His Majesty's Consul-General at Salonica (Mr. F. E. Crow) reports that the Wireless Telegraphy Board in Athens has decided to allow the use of radio-receiving sets in Salonica and Cavalla. The necessary licences for the installation of receivers must be obtained from the Wireless Department of the Post Office in Athens. For the time being permission will only be granted to Greek subjects, but it is thought that the privilege will shortly be extended also to foreigners. Macedonia is a virgin market for the sale of wireless apparatus. British manufacturers wishing to do business there should therefore communicate at once with local dealers and agents, quoting prices and sending illustrated catalogues in French, if possible, as well as English. The names of the principal dealers in electrical goods, also those of small dealers in wireless apparatus, can be furnished on application to the Department of Overseas Trade.

South Africa.—SINGLE MANAGEMENT—The recently-formed South African Broadcasting Co., after having taken over and resuscitated the Johannesburg station, has since also purchased the Cape Town station and entered into an agreement with the Durban Town Council to take over its station, which is unique in South Africa in being owned by the municipality, and the transfer takes place on July 1st next. With all the South African broadcasting stations now under one management, it is intended to interconnect them all with land lines and take full advantage of relaying, and it is hoped, by establishing further relay stations, to enable the small crystal user to benefit in various parts of the country. The new company, being also interested in the African Theatres Trust, intends to transmit items from various theatres with greater variety of artistes than there is under present arrangements.

United States.—EXPORTS.—The United States Trade Commissioner at Ottawa has reported to the Dominion Bureau of Statistics that the exports to Canada of radio sets and parts from the United States during the calendar year 1926 amounted in value to £2,872,991, and included the following items: 32,768 receiving sets, worth £1,238,680; 96,059 valves, valued at £113,837; and £1,520,474 worth of parts and accessories.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the ELECTRICAL REVIEW containing the advertisement is given in parentheses below.

Contracts Open.

Australia.—MELBOURNE.—August 15th. Postmaster-General's Department. One 55-ton 3-motor-type electrically-operated overhead travelling crane. (A.X. 4727.)*

August 16th. Automatic telephone exchange equipment. (B.X. 3566.)

November 14th. State Electricity Commission of Victoria. Two 10,000-kW back-pressure turbo-generators and accessory plant.

SYDNEY.—July 18th. Municipal Council. Boiler-house equipment for the Bunnerong power station. (B.X. 3531.)*

August 15th. Generator neutral earthing resistance. (B.X. 3550.)*

Cheadle and Gatley.—June 28th. Electricity Department. Static transformer, e.h.p. switch cubicle, and transformer switch and distributor kiosk. (June 10th.)

East Ham.—June 29th. Education Committee. Wiring at Mondega Road School. Secretary, Mr. F. R. Thompson, Education Offices, Town Hall, East Ham, E.6.

Edinburgh.—June 25th. Education Authority. Electric light and power installation at Bellevue Technical and Commercial School. Schedules, Mr. J. A. Carfrae, architect, 3, Queen Street, Edinburgh.

Flint and Hope.—July 5th. Flintshire E.C. Electric light installation at schools. Mr. R. G. Whitley, county architect, Mold.

Harrogate. — June 27th. Electricity Department. Transformers, meters, house-service fuse boxes. (June 17th.)

Halifax.—June 25th. T.C. Wiring 118 houses, Albert Road, for electric light; borough engineer. (Returnable deposit of £2 2s.)

Hazel Grove and Bramhall.—June 28th. Urban District Council. 2,800 yd. .06 3-phase, 6,600-V cables, including laying and accessories. (June 17th.)

Huddersfield.—July 4th. Education Committee. Electric light installation, Almondbury, Berry Brow, Crosland Moor and Paddock schools. Borough architect, 26, Ramsden Street.

India.—SIMLA.—July 25th. India Stores Department. Electrical cooking appliances for the Government House, New Delhi. (B.X. 3575.)

Kirkcaldy.—July 2nd. Electricity Department. L.p. a.c. distribution, l.p. and e.h.p. cables, boxes, and roadwork. (June 10th.)

Leamington Spa.—July 1st. Town Council. Five centrifugal pumps, with five electric motors, suction and delivery piping, valves, automatic control gear, &c. Particulars from Mr. S. C. Eagles, civil engineer, 71, Temple Row, Birmingham.

London.—STEPNEY.—July 11th. Electricity Supply Department. Boilers and boiler-house accessories, turbo-alternator, condenser, accessories, and switchgear. (June 3rd.)

LEWISHAM.—July 4th. Board of Guardians. Steam and electric steriliser plant, for the operating theatre. Mr. G. W. Martin, consulting engineer, 33, Arran Road, Catford, S.E.

Lurgan.—June 30th. Electric lighting plant, pump, &c., for the Maralin rectory and church. Specifications from Mr. C. Nicholson, secretary, Maralin, Lurgan.—*Irish Electrician.*

Newcastle-under-Lyme.—July 11th. Electricity Supply Department. 350-kW rotary convertor, with e.h.p. and l.p. switchgear. (See this issue.)

New Zealand.—Wellington.—August 9th. Public Works Department. 1,500 suspension insulator strings and 470 strain insulator strings. (B.X. 3533.)*

August 18th. Corporation Tramways. One electrically-operated tramcar traverser. (A.X. 4801.)

September 13th. Two sets 110-kV outdoor switchgear for the Waikato electric power scheme. (B.X. 3579.)

October 4th. Batteries and charging sets for Mangahao electric power scheme. (B.X. 3580.)

Plymouth.—July 6th. Mental Hospital Visiting Committee. 50-h.p. oil engine electric generating set for the mental hospital, Blackadon. Town clerk, Municipal Buildings.

Pudsey.—June 28th. Electrical installations for 96 houses, Smithroyd Park. Specifications, &c., from Mr. B. H. Noble, borough surveyor, Town Hall.

Shitlington, West Riding.—July 19th. West Riding Education Committee. Electrical installation for the Middlestown new school. Specifications, &c., from Education Department, County Hall, Wakefield.

Singapore.—July 25th. Municipal Commissioners. One 10,000-kW turbo-alternator and condensing plant. (See this issue.)

Smethwick.—June 25th. Smethwick and Oldbury Joint Hospital Committee. Electric lighting installation at the Holly Lane Hospital. Mr. F. Chapman, clerk.

South Africa.—Cape Town.—June 30th. South African Railways and Harbours Board. Gasfilled and vacuum lamps for 12 months. (B.X. 3518.)* Telegraph material. (B.X. 3519.)*

Pietermaritzburg.—July 13th. City Council. Single- and 3-phase electric motors and starting switches for 12 months.—City Electrical Engineer. *South African Mining and Engineering Journal.*

Southend-on-Sea.—July 6th. Light Railways and Electricity Department. L.p. and e.h.p. cables for 12 months. (June 3rd.)

July 5th. 3,000 meter boards. (June 17th.)

Whitehaven.—July 1st. Rural District Council. Installing two miles of overhead cable and erection of fittings, &c., in connection with the electric lighting of streets at Moresby Park Village. Mr. W. J. Goode, engineer and surveyor, Union Hall, Whitehaven.

---

* Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Basingstoke.—Town Council. Accepted:—

Wiring 126 houses for electric light at £639.—T. M. Kingdon & Co. (Thirty-nine tenders were received, the highest being £2,400.)

Birmingham.—Board of Guardians. Accepted:—

Wiring contract for the Western Road Institution (£115).—T. Glover.

Bradford. — Health Committee. Grassington Sanatorium :—

One 75-kW high-speed engine (£396).—Belliss & Morcom, Ltd.

One 75-kW direct-coupled generator (£329).—English Electric Co., Ltd.

Overhauling and repairing horizontal engine (£120).—Newton, Bean & Mitchell.

Tramways Committee.

100 steel tramcar tires for D.K. trucks (£235).—Vickers, Ltd.

Government Contracts.—The following contracts were placed by various Government departments during May, 1927 :—

Admiralty Contract and Purchase Department.

Electric cable.—British Insulated Cables, Ltd.; Edison Swan Cables, Ltd.; General Electric Co., Ltd.; Siemens Bros. & Co., Ltd.; Enfield Cable Works, Ltd.

Electric hot cupboards.—Benham & Sons, Ltd.

E.h.p. cables.—W. T. Henley's Telegraph Works Co., Ltd.

Aluminium alloy lamp fittings.—General Electric Co., Ltd.; W. McGeoch & Co., Ltd.; Engineering and Lighting Equipment Co., Ltd.; J. Beresford & Sons, Ltd.

Motor reducer set.—Laurence, Scott & Co., Ltd.

Electric bakery plant.—Carron Company.

Motor-driven pumps.—J. Stone & Co., Ltd.

Switch and sockets.—General Electric Co., Ltd.

W/T valves.—Mullard Radio Valve Co., Ltd.

War Office.

Overhead travelling electric crane.—Royce, Ltd.

X-ray sets.—Solus Electrical Co.

Air Ministry.

Accumulators.—C. A. Vandervell & Co., Ltd.

Amplifier.—Gambrell Bros., Ltd.

Battery charging panels (various stations).—Harland Engineering Co., Ltd.

Motor-generator sets (various stations).—General Electric Co., Ltd.

Stand-by generating sets (Kenley and Suttons Farm).—Aster Engineering Co. (1913), Ltd.

Underground cables (Upper Heyford).—Malcolm & Allen, Ltd.

W/T transmitting station (Mitcham).—Pearce Bros.

Delco ignition spares.—Delco-Remy & Hyatt, Ltd.

Receivers.—H. W. Sullivan, Ltd.

Telephone and headbands receivers.—Standard Telephones and Cables, Ltd.

Transmitting and receiving sets.—Marconi Wireless Telegraph Co., Ltd.

Post Office.

Telephone apparatus.—Ericsson Telephones, Ltd.; International Electric Co., Ltd.; Siemens Bros. & Co., Ltd.; Standard Telephones & Cables, Ltd.

Testing, protective and miscellaneous apparatus.—Phœnix Telephone & Electric Works, Ltd.

Battery stores.—Hart Accumulator Co., Ltd.

Terminal blocks.—T. De la Rue & Co., Ltd.

Battery boxes.—Siemens Bros. & Co., Ltd.

Cable (various).—British Insulated Cables, Ltd.; Connollys (Blackley), Ltd.; Enfield Cable Works, Ltd.; W. T. Glover & Co., Ltd.; Hackbridge Cable Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Johnson and Phillips, Ltd.; Pirelli-General Cable Works, Ltd.; Siemens Bros. & Co., Ltd.; Standard Telephones and Cables, Ltd.; Union Cable Co., Ltd.

Casing and cover.—W. Duncan Tucker & Sons, Ltd.

Joint box castings.—United Steel Co., Ltd. (T. Butlin and Co. Branch).

Cords for telephones.—London Electric Wire Co. & Smiths, Ltd.

Ironwork.—Bullers, Ltd.

Mouthpieces.—North British Rubber Co., Ltd.

Distribution cable plugs.—Siemens Bros. & Co., Ltd.

Wire.—W. T. Henley's Telegraph Works Co., Ltd.

New lift and extension to existing lift, Post Office Stores Department.—W. Wadsworth & Sons, Ltd.

Radio station switchgear and cabling (Portishead).—Drake and Gorham, Ltd.

Valve transmitter (Humber).—Radio Communication Co., Ltd.

Telephone Exchange equipment.—Lofthouse Gate (Wakefield Multi Office Area) : Siemens Bros. & Co., Ltd. Sub-contractors : Small Electric Motors, Ltd., for ringing machines. Goole (Yorks) : Siemens Bros. & Co., Ltd. Sub-contractors : Hart Accumulator Co., Ltd., for batteries; Crompton & Co., Ltd., for ringing machines; English Electric Co., Ltd., for charging machines. Harpenden (Herts) : Siemens Bros. & Co., Ltd. Sutton (Surrey) : General Electric Co., Ltd. Sub-contractors : Chloride Electrical Storage Co., Ltd., for batteries; Crompton & Co., Ltd., for machines. Archway (N.) : General Electric Co., Ltd. Sub-contractors : D.P. Battery Co., Ltd., for batteries; Crompton & Co., Ltd., for machines. Wilmslow (Cheshire) : General Electric Co., Ltd. Maryland (E.) and African and Eastern Trade Corporation, Ltd. (Liverpool) : Standard Telephones and Cables, Ltd. Chapeltown (Leeds) and Shrewsbury : Automatic Telephone Mfg. Co., Ltd. Cobham (Surrey) : Ericsson Telephones, Ltd. Liverpool Warehousing Co., Ltd. (Liverpool), G. Salter and Co., Ltd. (West Bromwich), Shell-Mex, Ltd. (W.C.), Accles & Pollock, Ltd. (Oldbury) : Relay Automatic Telephone Co., Ltd.

Crown Agents for the Colonies.

Cables.—W. T. Henley's Telegraph Works Co., Ltd.

Generators.—Electric Construction Co., Ltd.; J. Stirk and Sons, Ltd.

Insulators.—Taylor, Tunnicliff & Co., Ltd.

Switchgear.—British Thomson-Houston Co., Ltd.

Telephones : Standard Telephones and Cables, Ltd.

Train lighting equipment.—Chloride Electrical Storage Co., Ltd.; J. Stone & Co., Ltd.

Transformers.—British Electric Transformer Co., Ltd.; Brush Electrical Engineering Co., Ltd.

Irish Free State.—Controller of Stores (Posts and Telegraphs).

Broadcasting apparatus.—British Thomson-Houston Co., Ltd.; General Electric Co., Ltd.

Cable (various).—Routledge & Co.

Cable drums.—Siemens Bros. & Co., Ltd.; McMillan and Co.

Jacks (telephone).—Phœnix Telephone and Electric Works, Ltd.

Platinum contacts.—Marconi (Ireland), Ltd.

Radiators.—British Thomson-Houston Co., Ltd.

Receivers (for telephones).—Ericsson Telephones, Ltd.

Relays (for telegraphs and telephones).—Standard Telephones and Cables, Ltd.

Sets (for telegraphs and telephones).—Hart Accumulator Co., Ltd.
Switches.—Walters Electrical Manufacturing Co., Ltd.
Thermographs.—Cambridge Instrument Co., Ltd.
Transmitters.—Phœnix Telephone and Electric Works, Ltd.
Wireless telephone installations.—Marconi (Ireland), Ltd.
—*Irish Electrician.*

Llanfairfechan.—Urban District Council. Accepted:—
Mains (cables).—British Insulated Cables, Ltd.
Trenching and cable laying.—Durnford Construction Co., Ltd.
Transformers and switchgear.—English Electric Co., Ltd.

London. — SHOREDITCH.—Lighting Committee. Recommended:—
Ventilating equipment at Evelyn sub-station (£460).—Davidson & Co., Ltd.
Ash-handling and storage plant at the Whiston Street generating station (£1,055).—Fraser & Chalmers Engineering Works.
New feed water mains in connection with the boiler extension at Whiston Street (£700).—Babcock and Wilcox, Ltd.
Air filter at Coronet Street sub-station (£180).—Davidson and Co., Ltd.
L.p. cable (£1,172).—W. T. Glover & Co., Ltd.

HAMMERSMITH.—Electricity Committee. Recommended:—
Three 250-kW, eight 200-kW, and three 50-kW air-cooled transformers (£3,044).—British Electric Transformer Co., Ltd.
E.h.p. ironclad switchgear (£793).—Metropolitan-Vickers Electrical Co., Ltd.
60 h.p. switches (£917) and twelve 10,000-amp. circuit breakers (£107).—J. G. Statter & Co.
Three 6-way and two 4-way l.p. fuse units (£108).—Lucy and Co., Ltd.
11,000-V, 6-core cable (£2,147).—Hackbridge Cable Co., Ltd.
Repair and overhaul of single-phase switchboard (£121).—Switchgear & Cowans, Ltd.

Manchester.—Tramways Department. Accepted:—
Fifty type W.T. 31K. motors (50 h.p. rating).—General Electric Co., Ltd.

South Africa.—DURBAN.—Municipal Council. Accepted:—
Cables and switchgear in connection with the linking-up the Congella power station and the municipal power station:—
Cables (£25,172).—British Insulated Cables, Ltd.
Switchgear (Congella) (£5,864); ditto, municipal power station (£1,592).—A. Reyrolle & Co., Ltd.
Regulators and reactances (Congella) (£3,008); reactors (municipal power station) (£617).—Metropolitan-Vickers Electrical Co., Ltd.

JOHANNESBURG.—Municipal Council. Accepted:—
1,000 primary fuses and plugs (£317).—South African General Electric Co., Ltd.
3 miles h.d. trolley wire (£288).—British General Electric Co., Ltd.
24 6,600/110-V, single-phase potential transformers (£200). A.E.G. Engineering Co. (S.A. Proprietary), Ltd.
One mile h.p. cable (£1,031).—W. T. Henley's Telegraph Works Co., Ltd.
—*S.A. Mining and Engineering Journal.*

Stretford.—Health Committee. Accepted:—
Electrolysing plant at Empress Street depöt (£118).—Mather & Platt, Ltd.

Electricity Committee. Accepted:—
Electric lamp columns (56s. 3d. each).—R. A. Bradshaw and Son.

Wakefield.—Housing Committee. Accepted:—
Wiring 200 houses on the Snapethorpe estate.—J. E. Fowler.

Woodford.—Urban District Council. Accepted:—
Installation of internal telephone system at Council offices, and maintenance.—Commercial Telephone & Electrical Co.

Forthcoming Events.

Electrical Contractors' Association.—June 22nd to 25th. Scarborough Annual Conference.

Physical Society.—Friday, June 24th. Imperial College of Science, S. Kensington, S.W. 5 p.m. Ordinary meeting.

Institution of Mining Engineers.—June 29th to July 1st. Newcastle-upon-Tyne. General meeting.

Tramways and Light Railways Association.—June 29th to July 1st. Bath. Annual Congress.

Institution of Electrical Engineers (South-Midland Centre).—Thursday, June 30th. Visit to Dolgarrog.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

DAYKOL daylight fittings.
TELLUS vacuum cleaners.

Readers occasionally desire to be put in touch with companies undertaking to finance hire-purchase schemes for domestic apparatus, such as vacuum cleaners, cookers, &c. We should be glad to learn the name of any reliable concern of this nature.

Notes.

Electrical Questions at the League of Nations.

Mr. D. N. Dunlop has been appointed the British representative on the Permanent Committee on Electrical Questions set up by the Advisory and Technical Committee for Communications and Transit of the League of Nations. The agenda for the meeting held in November, 1926, included the three following matters:—

(*a*) The ratification of the conventions adopted in 1923 relating to the transmission in transit of electric power, and to the development of hydraulic power.

(*b*) The establishment of an international centre of information.

(*c*) The relations of the Committee with other international organisations dealing with electric questions.

Mr. Dunlop, in addition to being director of B.E.A.M.A., is chairman of the International Executive Council, World Power Conference, and of the British National Committee.

The Use of Photo-Electric Cells in Photometry.

Amongst the papers read at the meeting of the Optical Society on June 9th was one by Mr. T. H. Harrison, Ph.D., B.Sc., who gave a description of apparatus and experiments designed for obtaining the highest accuracy and precision in the photometry of electric lamps, using photo-electric cells. Although the methods adopted were not novel, every care had been taken to obtain the highest sensitivity in the photo-electric current measuring apparatus and to maintain the lamps at a steady accurately-known voltage. It was claimed, therefore, that the results were useful in showing the maximum capabilities of photo-electric cells when used in the usual manner with a sensitive electrometer or electroscope. The actual results obtained were tabulated, and an examination was made of the sources of error to be expected, of the method by which they might be avoided, and of the computation of the accuracy of the results.

The I.E.E. Wiring Regulations.

We have received from the Institution of Electrical Engineers a copy of the 9th edition (May, 1927) of the "Regulations for the Electrical Equipment of Buildings," which is published by Messrs. E. & F. N. Spon, Ltd., price 1s. 6d. (cloth), or 1s. (paper), plus postage 2d. Copies can also be obtained from the Institution.

A footnote states that this edition contains a number of alterations which had become urgent, but does not differ considerably from the eighth edition. It appears that the alterations and additions approved by the Council on July 16th, 1925, and issued in the form of a pamphlet have been incorporated in the text of the 9th edition, but a comparison of the two books indicates that there are many minor additions and omissions, transpositions, &c., which render the task of identifying the changes very laborious. For instance, the old Regulation 64, "Main Switchgear," has in modified form been included under the more appropriate heading, "Control of Supply," Regulation 94, in the new issue. The total number of clauses remains at 128, and of the tables at xiv. Appreciable alterations have been made in Tables IV, vulcanised rubber cables; V, impregnated-paper and lead-covered cables; VI, flexible cables for use with portable appliances; and VIII, flexible cords. These changes are mainly in the current-carrying capacity; in some cases the amperage has been increased by 40 or 50 per cent. (flexible cords), or 30 per cent. (flexible cables for portable appliances) throughout, but in others the changes are partly one way and partly the other.

The Wiring Regulations Committee has in preparation a Tenth Edition, which, with a view to simplification, may differ materially from the Ninth in respect of arrangement and wording.

The Extra-High-Pressure Conference at Paris.

The headquarters of the British members attending the above conference will be the Hotel Campbell, 47, Avenue de Friedland. This hotel is quite near the Salle Hoche, where the conference will take place, and will form a very convenient place of meeting for those attending the conference, even if they do not happen to stay at the hotel.

Centenary Lecture.

In a lecture recently given by Dr. J. A. Fleming in connection with the centenary celebrations of University College, University of London, he referred to the strides which had taken place in the work of electrical communication and to the contributions made by men like Alexander Graham Bell. Although the practical applications of electricity had largely come from America, the fundamental ideas were to a great extent due to British scientists. Dr. Fleming said it was the electrical engineer who met those imperative needs which the pressure of population on the means of existence brought about.

The I.M.E.A. Exhibition.

In addition to the exhibits referred to in our last three issues at the exhibition of apparatus held in connection with the Convention of the Incorporated Municipal Electrical Association at Buxton, some items which should not be passed over were seen on the stand of Messrs. B.E.N. PATENTS, LTD. A feature of this stand was the "Ben-Myers" car-washer. This is an electrically-driven outfit by means of which, it is claimed, a car can be washed in 20 minutes. The pump is totally enclosed and runs in oil. All the parts are interchangeable and easily accessible. The water stream can be instantly regulated to any pressure up to 400 lb. per sq. in. A variety of portable electric tools included recently introduced models of electric hand saws with 6-, 8- and 10-in. diameter saw blades; a range of electric drills driven by motors of ¼, ⅓, ½ and 1 h.p. for drilling holes in steel up to 1¼ in.; the "Speedway" portable hammer, a suitable device for drilling in concrete, brick, stone, and so on, made in two sizes, capable of drilling ½-in. and 1-in. holes at 3,000 and 1,800 blows per min., respectively; and the U.L.A. general utility tool with the necessary attachments for grinding, scratching, buffing, sawing, drilling, and other operations. A feature of the apparatus shown was the "Alta" lock mortiser, an electrically-driven apparatus which, it is claimed, will cut an ordinary mortise in less than a minute; stock cutters of ⅝ in. and 1¼ in. are available for this machine. The "Turner Timer" commutator for Ford automobiles was to be seen on this stand; it is claimed that the long hot spark created by the wide wipe contact results in a saving of 10 to 15 per cent. in petrol consumption. Some "Maimin" electric cloth cutters were also shown; the "Maimin Automatic" cutter employs a straight knife and is carried on a bracket; the "Maimin Six" model is of the circular-knife type and is carried in the hand. Each model carries a guiding lamp. Other exhibits included snap ball joints, and a variety of portable "Alta" electric tools.

Short-circuit Fuse Tests.

On Tuesday next, June 28th, Messrs. Parmiter, Hope and Sugden, Ltd., by the courtesy of the St. James' and Pall Mall Electric Lighting Co., London, will carry out a series of short-circuit tests on their fuses at the Marshall Street, Beak Street, power station of the St. James' Co. Those interested may obtain invitations to be present at the demonstration from the London office of Messrs. Parmiter, Hope & Sugden, Ltd., 25, Victoria Street, Westminster, S.W.1. The tests will be on similar lines to those which took place in Manchester in March last year.

Institution of Civil Engineers' Exhibition.

In connection with the conversazione of the Institution of Civil Engineers, held at the Institution on June 15th, a number of engineering models, pieces of scientific apparatus, &c., were exhibited. Included in the items shown was the Yarrow-Hyde bed which is designed to promote sleep by imitating as far as possible, in amplitude and frequency, the motion of a train on the Canadian Pacific Railway; Sir Alfred Yarrow, the originator of the bed, during a journey from Vancouver to Montreal, found that he slept much better when the train was in motion than when it was still. The bed is hinged at the foot, and a simple harmonic motion is applied to the head of the bed by means of an electrical drive through a double eccentric. At the points of synchronism of the two eccentrics the bed has its maximum and minimum lifts, giving a gradual rise and falling off of the motion. A model for demonstrating the flow of lubricant in a bearing was shown by Prof. B. P. Haigh, D.Sc., and Mr. F. W. Thorne, A.M.Inst.C.E. The Selenyi method of measuring vacuum in electric lamps was exhibited by Mr. J. T. Randall, M.Sc., of the Research Laboratories of the General Electric Co., Ltd. This was also exhibited at the Royal Society's Soiree this year, and described in the ELECTRICAL REVIEW on May 27th, p. 836. The same applies to a new thermostat which was shown by Lt.-Commander F. J. Campbell Allen and Mr. A. E. Salisbury (ELECTRICAL REVIEW, May 20th, p. 792). The National Physical Laboratory had a number of exhibits, which included apparatus for measuring the speeds of vacuum pumps and gas analysis apparatus utilising high-frequency vibrations. Exhibits by Mr. T. Gill, International Standard Electric Corporation, included: apparatus for precision measurements of circuit efficiencies as used on the Anglo-American Transatlantic telephone service; apparatus for comparing the qualities of two loud-speakers; photographs of the radio-telephone equipment at the Rugby radio station; and photographs illustrating the progress of telephony in Spain. An experimental exhibit by Mr. Leonard Andrews, M.B.E., demonstrated the principle of kinetic elutriation, which, it is suggested, may have a field in connection with the use of pulverised fuel. The treatmen provides for the disassociation of the particles bound togethe by surface tension, imparting a high velocity to the particle and passing them through a vortex chamber wherein, unde the combined influences of centrifugal force, gravity and edd currents, they automatically arrange themselves in tw separate streams of water, carrying coarse and fine particle respectively.

Smokeless Fuel.

According to the *Morning Post*, the Government has agree to contribute, under the Trade Facilities Act, a sum which i stated to be £100,000 towards the establishment of a nev company to be known as Fuel Utilisation, Ltd. This compan will operate works at Richmond for the production, on a experimental basis, of smokeless fuel and motor spirit. Th plant has been designed by the Fuel Research Division of th Scientific and Industrial Research Department, and was chose after an exhaustive investigation of coal distillation plants al over the world. The investigation has been conducted, unde the supervision of Sir David Milne Watson, by the Gas Ligh and Coke Co., which is associated with the new undertaking The works will be operated intensively for three years to pro vide working data. At the expiration of this period the result will come under review, and the works will be extended on commercial basis, or closed down altogether.

Inquiry into an Acton Explosion.

An explosion which occurred at Acton on February 19th last and resulted in the destruction of premises in Beaconsfield Road, and injuries to the occupants (proving fatal in one case), was the subject of an inquiry which was opened a Acton Town Hall on June 17th, by Mr. G. Scott Ram M.I.E.E., and Dr. J. S. Haldane, F.R.S., who were appointed by the Electricity Commissioners under the provisions of the Electricity (Supply) Acts, to report upon the matter. The supply is given by the Metropolitan Electric Supply Co., Ltd. The explosion occurred in the early hours of the morning, and about that time a fault developed in the electrical distribution system at that point. The reason for the explosion is obscure. Among the theories put forward is one to the effect that bitumen gas was generated from a feeder cable which was laid in bitumen in the road, and was burned out at one point, and that the explosion was due to the ignition of this gas. On the other hand, it was suggested that the explosion might have resulted from an escape of coal gas. The circumstances with regard to the electrical fault were stated to be as follows. There was a distributor along the road on the opposite side to that on which the destroyed premises were situated, and, parallel with it, a "Dialite" feeder, which latter was laid in bitumen, about twenty years ago, by the Acton U.D.C., before the Metropolitan Co. took over the supply. From the distributor there was a branch at right angles, crossing the road, from which the destroyed premises were supplied. This distributor crossed the feeder. Evidence was given by Mr. A. Richardson (mains foreman to the Metropolitan Co.) to the effect that he had received a telephone message from the substation that a fault was developing on the feeder. The area having been isolated, he found that a fault had occurred in the distributor at the point where it crossed the feeder; the latter was burned away for a distance of about 18 in. on either side of the junction. From a point half way across the road, and in the direction of the feeder, the distributor was bared. He considered that a fault had occurred in the distributor, at a point about half way across the road, and had developed away from the destroyed premises and towards the feeder. When the distributor was taken out, it was found that from the middle of the road to the service box outside the destroyed premises it was in good condition, and the service cable showed no signs of a short circuit. Nine months earlier the occupier of the destroyed premises had complained of an odour, and he (Mr. Richardson) had opened the ground to investigate. On that occasion he had noticed a smell of coal gas, which might have been due to leakage under the ground. Cross-examined by counsel for the Gas Light & Coke Co., witness agreed that there had been trouble with the electrical distribution system at this spot on three occasions in about three years.

Other evidence was given by a number of witnesses, including representatives of the Metropolitan Co., and the inquiry was adjourned until June 20th. The Court intimated that it would inspect the ground in the area affected before the resumption of the proceedings.

Among those who gave evidence on June 20th was Dr. C. J. J. Fox (Messrs. Cross & Bevan, consulting and analytical chemists), who considered it improbable that the explosion was due to bitumen gas; the destruction was out of all proportion to the volume of gas that would be generated. Apart from that, the gas would have been diluted with air to such an extent that the mixture would not have been explosive.

Mr. Hugh Bourne, M.I.E.E. (Messrs. Albion T. Snell and Partners), who gave evidence on behalf of the owner of the destroyed premises, thought that the initial fault took place in the bitumen feeder itself, and that the distributor crossing the road was destroyed as the result of the temperature of the gases generated by the fault in the feeder.

Witnesses were called on behalf of the Gas Light and Coke Co., whose evidence was to the effect that there had been no complaints with regard to the escape of gas in the neighbourhood.

Mr. Frank Hipwell (secretary of the Metropolitan Electric Supply Co.) said that the policy of the company was to

replace the bitumen cables with paper-insulated cables. Approximately £60,000 had been spent on these replacements. It was suggested by Mr. Trevor Watson (on behalf of the Gas Light and Coke Co.) that the company's decision was dictated not merely by financial considerations, but because it knew that bitumen cables were likely to cause danger. Witness did not agree.

Dr. R. V. Wheeler said that, assuming no match had been lit on the premises at the time of the explosion—and the evidence was that no match had been lit—it was just conceivable that the gases rapidly evolved from the bitumen might have been projected through the conduit into the building at a sufficiently high temperature to cause them to ignite of their own accord when they came into contact with air. Another possibility was the presence of an electrostatic charge at the orifice through which the gas flowed, if it were flowing at a sufficiently high speed.

The tribunal will report to the Electricity Commissioners in due course.

Scottish Electrical Contractors.

The annual meeting of the Electrical Contractors' Association of Scotland was held in Glasgow on June 8th; the president, Mr. William Mackintosh (William Douglas, Ltd., Edinburgh), presided. Satisfactory reports were submitted from the branches and the committees of the Central Board, and a substantial increase in membership was again reported. Views were exchanged as to the results of the E.D.A.-E.L.M.A. campaign, and reference was made to the new campaign meditated by E.D.A. for the coming winter. The following new office bearers were elected:—President, Mr. James Allan (Malcolm and Allan), vice-president, Mr. J. J. Foggo (Messrs. John Foggo & Sons). After the meeting the members present were entertained to lunch by the Glasgow Branch in the Royal

Scottish Electrical Contractors.

Hotel, and in the afternoon the usual golf match, East *v.* West, was played at Erskine Golf Course, on the banks of the Clyde. Rain fell heavily on the motor run down to the course, but later the sky cleared. All the members took some part in the match, the non-golfers acting as honorary caddies for the time being. The match resulted in a win for the East by nine matches to six and at a gathering which followed, the Pratt Trophy, which was instituted in 1914, was presented to Mr. A. J. Shand, chairman of the Edinburgh Branch, by the new president, Mr. Allan. Some of the members who took part in the match appear in the accompanying picture.

Week-End Conference.

"Wage Payments and Incentives and Women in Industry" is the subject for discussion to be opened by Miss Caroline Haslett, director of the Electrical Association for Women, and secretary of the Women's Engineering Society, at a week-end conference promoted by the National Industrial Alliance. This gathering has been arranged at the Retreat, Pleshey, Chelmsford, for July 2nd-3rd, 1927. The guests will be equally representative of employers and employés. Accommodation is still available, and particulars will be furnished on application to the Secertary of the Alliance, 25, Queen Anne's Gate, S.W.1.

Electrical Association for Women.

Members of the South Wales and Monmouthshire Branch of the E.A.W., on June 15th, attended a demonstration of clean milking, given under the auspices of the Glamorgan Agricultural Committee, by Miss V. D. Harrison, at Mr. J. H. Merrett's farm at Penylan.

The Electrical Trades Benevolent Institution.

An extraordinary general meeting of this Institution is to be held at 36/38, Kingsway, on Wednesday, June 29th, at 2.30 p.m., to confirm the resolution passed at the annual general meeting held on April 28th that the new rules as submitted be approved and adopted.

Appointments Vacant.

Telephone maintenance inspectors (250 taels per month; tael=2s. 6d.) for the Shanghai Mutual Telephone Co., Ltd. Junior charge engineer for the Gloucester Corporation Electricity Department. Assistant engineer for the Bhatpara Power Co., Ltd. (See our advertisement pages to-day.)

Late Legal.

Alleged Conspiracy to Defraud.—At the Mansion House on Tuesday last the adjourned summonses against Sir Charles Buckworth Herne-Soame, Bt., Edward Warden, Col. Edmund Octavius Eaton, and Robert George Harley were again called. The charges against them were that between January, 1914, and the present time they had "conspired together, and with other persons, to cheat and defraud such persons as might receive prospectuses and pamphlets issued by the Chalk Fuel and Gas By-Products Corporation, Ltd."; and of conspiring "to obtain money from them by falsely pretending that certain reports appearing in the prospectuses and pamphlets were true." The prosecution stated that Col. Eaton was unable to attend on account of ill-health, and that Sir C. Herne-Soame, who was prepared to attend, had been advised that his presence was not necessary in view of the other defendant's condition. Harley was in court, but Warden was absent. The summonses were further adjourned until September 21st.

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements

Mr. Bancroft Gherardi, vice-president and chief engineer of the American Telephone and Telegraph Co., has been elected president of the American Institute of Electrical Engineers for the year commencing August 1st.

We regret to learn that Mr. John Roberts, borough electrical engineer of Durban, has broken down in health. He is now recuperating in the Cape, and, we are pleased to hear, is regaining his health. His assistant, Mr. E. Poole, has, in the interim, been appointed acting borough electrical engineer.

On the occasion of his marriage, Mr. A. C. Watts, of Tunbridge Wells, has been presented with a chiming clock by the electrical contractors of Tunbridge Wells, with a similar clock by the electrical contractors of Sussex, and with a coffee service and inlaid tray by the staff of the Premier Electrical Co.

Mr. N. R. Keast, of Wrexham, has been appointed mains engineer by the Lowestoft Corporation Electricity Supply and Tramways Department.

Mr. A. B. Eason, assistant engineer in the Engineer-in-Chief's Office in the G.P.O., has been promoted to the position of executive engineer.

Obituary.—Mr. G. E. Tripp.—The death occurred in hospital at New York, following an operation, on June 14th, of Mr. Guy E. Tripp, chairman of the board of directors of the Westinghouse Electric and Manufacturing Co. He was 62 years of age. Mr. Tripp was a prominent figure amongst American electrical industrial leaders, and in addition to his connection with various non-electrical corporations, he was also associated with the Radio Corporation of America and the International Radio Telegraph Co. Getting on for twenty years ago he took a foremost part in the reorganisation of the street railway system of New York and during the war he was made a brigadier-general and made huge purchases of materials on behalf of the U.S. Government.

Mr. H. Morris-Airey.—We regret to record that Mr. Harold Morris-Airey, C.B.E., M.Sc., M.I.E.E., died at Southsea on Sunday, aged 47 years. For the past seven or eight years he had been chief technical adviser at H.M. Signal School, R.N. Barracks, Portsmouth, where he had been engaged on wireless telegraph apparatus development for the Navy.

Mr. W. M. Rogerson.—We deeply regret to record that Mr. William Michael Rogerson, borough electrical engineer and manager of Halifax, passed away suddenly on Thursday last week. He was present at the convention of the I.M.E.A. at Buxton, but for some time past he had not been in the best of health and after his return home he was obliged to remain there for some days. With the permission of his doctor, we understand, he proceeded to a meeting of his Committee on the morning of the 16th inst., but on entering the Town Hall he had a heart attack, from which he never recovered. Mr. Rogerson, who has thus died in harness, was 55 years of age. He had been at Halifax since November, 1901, proceeding there from Nottingham, where he was chief assistant electrical engineer for seven years. When he took up his Halifax post the plant capacity was 3,000 kW; to-day it is 31,000 kW. He was devoted to his work and took pride in the development of his undertaking and especially in the linking-up of the Halifax and Huddersfield systems. For a short period he was both borough electrical engineer and tramways engineer, but latterly the offices have been separated. Mr. Rogerson acted in an advisory capacity to the Government in connection with the lengthy negotiations in regard to the Aire and Calder electricity district scheme. During the war he was an officer in the Halifax Volunteers. He was a member of the Institution of Electrical Engineers. His numerous friends in the electrical industry will, we are sure, desire to associate themselves with us in our expression of sympathy with his widow and four daughters in their tragic loss. The funeral took place

on Monday. The bearers were six employés of the Electricity Department who had served under him for many years. The flag at the Town Hall was at half-mast. Those present at the funeral, in addition to Mrs. Rogerson, the daughters and other relatives, included a large number of members of the Corporation, Corporation officials, the staff of the electricity works, representatives of the Halifax Electrical Employés' Federation, the Social and Athletic Society of his department, representatives of electrical manufacturing concerns, city and borough electrical engineers from various parts, &c.; 120 employés of the Electricity Department, and 40 tramway employés walked in the procession.

Mr. M. Cookson.—The death has occurred at Kilda, Victoria, of Mr. Maynard Cookson, who for many years was in business as an electrical engineer in Southport. He went to Australia nearly four years ago.

Will.—Sir Wm. Mackenzie, chairman of the Brazilian Traction, Light and Power Co., and various other South American electrical companies, left £17,249 personal estate in England.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Neutron (1927), Ltd.—Private company. Registered June 11th. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers and buyers and sellers of chemical compounds, metals, and mineral ores; manufacturers of and dealers in mineral ores and other substances used as crystal detectors for wireless receiving sets, and in particular the crystal known as "Neutron"; to acquire the trade marks "Neutron," numbered respectively 452,957, 452,958, 457,747, and 465,321. The first directors are:—P. G. Marr, "Crossways," Whiteman's Green, Cuckfield, Sussex, merchant; W. Holt, address not stated; C. J. S. Norris, "Maylus," Norbury Crescent, S.W.16, C.A. Qualification: 1 share. Solicitors: John Hands & Son, 97, Gresham Street, E.C.2.

J. & C. Manufacturing Co., Ltd.—Private company. Registered June 9th. Capital, £1,250 in 750 ordinary "A" shares of £1 each, and 1,000 ordinary "B" shares of 10s. each. Objects: To acquire the business of manufacturers of and dealers in wireless telephony appliances now carried on by the proprietors of the J. & C. Wireless Company at Brighton. The first directors are:—N. G. Johnson, Le Pride, Henfield, Sussex; C. L. Clayton, Badger Wood, Fulking, Sussex; C. Hastings, 7, Northfield Road, Stamford Hill, N.; Secretary: C. Hastings. Solicitors: F. H. Nye, 15, Prince Albert Street, Brighton. Registered office: Royal Crescent Works, Marine Parade, Brighton.

Devereux, Ltd.—Private company. Registered June 13th. Capital, £1,000 in £1 shares. Objects: To acquire the business of an electrical engineer and manufacturer carried on by H. Devereux, at 1, Yukon Road, Balham, as "The Ajax Company," and to carry on the business of repairers of and dealers in electrical machines, including wireless telephony and telegraphy, &c. The first directors are:—H. Devereux (permanent managing director and chairman), 101, Tooting Bec Road, Upper Tooting, S.W.17, electrical engineer; E. le Maistre, 2, Furzedown Drive, Tooting Bec Common, S.W.17, general practitioner. Registered office: 1b, Yukon Road, Balham, S.W.12.

Mercury Electrical Appliances, Ltd.—Private company. Registered in Edinburgh June 17th. Capital, £500 in £1 shares. Objects: To carry on the business of electricians, mechanical engineers, &c. The directors are:—H. Manfred, 8, Westmorland Street, Glasgow, chemist; W. Morrison, 524, Cathcart Road, Glasgow, traveller. Qualification, 50 shares. Registered office: 158, Howard Street, Glasgow.

South American Public Utilities Trust, Ltd.—Private company. Registered June 14th. Capital, £110,000 in 80,000 ordinary shares of £1 each and 120,000 8 per cent. cumulative preference shares of 5s. each. The preference shares have priority for return of capital. Objects: To acquire shares, stocks, and securities of any company (wherever incorporated) formed for the purpose of constructing, purchasing, leasing, or otherwise acquiring, maintaining and working in any part of South America, tramways, railways, omnibuses, or other form of public transport, or of generating and supplying electricity for light, heat, power, and other purposes; to hold, sell, dispose of, or deal in such shares and securities; to construct or acquire, maintain and work tramways, railways, and omnibuses, and to generate and supply electricity in any part of South America, &c. The subscribers (each signing for one preference share) are:—D. Kemsley, Thrifts Hill, Theydon Bois, Essex, gentleman; E. J. McLellan, 130, Church Road, Upper Norwood, S.E., gentleman. Solicitors: Johnson, Jecke and Colclough, 24, Austin Friars, E.C.2.

Tully Gas Plants (1927), Ltd.—Public company. Registered June 16th, with a nominal capital of £140,000 in 300,000 10 per cent. non-cumulative participating preference shares of 1s. each and 500,000 ordinary shares of 5s. each. The objects are to acquire the undertaking and assets of Tully Gas Plants, Ltd., to adopt an agreement between Gas & Fuel Plants, Ltd., and its liquidators of the first part, Tully Gas Plants, Ltd., and its liquidator of the second part, Low Temperature Carbonisation, Ltd., of the third part, and J. Morgan, as trustee for and on behalf of the company, of the fourth part, and to carry on the business of gas, electrical, mechanical and general engineers, contractors, electricians, founders, smiths, manufacturers and suppliers of and dealers in gas, electricity, motive power, water and light, &c. The minimum cash subscription is 7 ordinary shares. The first directors are:—F. R. Wade, The Priory, Redbourne, Herts.; C. H. Parker, The Glen, Codsall, near Wolverhampton. Qualification (except first directors), £10 shares or stock. Remuneration: £150 each per annum (chairman £50 extra), free of income tax. Secretary: J. H. Macaulay. Solicitors: Jenkins, Baker & Co., 3, London Wall Buildings, E.C.2. The registered office is at 3 and 4, Clement's Inn, Strand, W.C.2.

Brockbank & Powell, Ltd.—Private company. Registered June 15th. Capital, £2,100 in 2,000 5 per cent. non-cumulative preference shares of £1 each and 2,000 ordinary shares of 1s. each. Objects: To carry on the business of importers, exporters, consulting and general engineers, mechanical, metallurgical, electro-metallurgical, and electrical engineers, &c. The first directors are:—C. J. Brockbank, F.C.I.C., 1,039, Oak Lane, Philadelphia, Pa., U.S.A., metallurgical chemist; H. H. Powell, A.M.I.E.E., Palace Chambers, Bridge Street, Westminster, S.W.1, engineer (both permanent, subject to each holding one share). Solicitors: Godfrey and Robertson, 40, Chancery Lane, W.C.2. Registered office: Palace Chambers, Bridge Street, Westminster, S.W.1.

Radi-Arc Electrical Co. (1927), Ltd.—Private company. Registered June 15th. Capital, £1,000 in £1 shares. Objects: To carry on the business of electrical and mechanical engineers, designers, &c. The directors are:—S. Blaiberg, 42, Fairhazel Gardens, Hampstead, N.W.6; Violet Erdman, 65, Fitzjohn's Avenue, Hampstead, N.W.3. Solicitors: A. W. Osmond, 6, South Square, Gray's Inn, W.C. Registered office: Bennett Street, Chiswick, W.4.

Reid Power Development Co., Ltd.—Public company. Registered on June 16th, with a nominal capital of £25,000 in 23,000 10 per cent. preferred participating ordinary shares of £1 each and 40,000 deferred ordinary shares of 1s. each. The objects are to acquire a licence from Electric Bulk, Ltd., to develop and form a company to erect a super-power station under the Reid Power process, and to carry on the business of promoting electricity and lime producing, and generally that of a contracting, commercial, financial, developing and producing association, especially with regard to electrical, lime, scientific, and geological matters, &c. The minimum cash subscription is 7 preferred participating ordinary shares. The first directors are:—Lt.-Col. the Hon. H. Scott Davey, C.M.G., 9, Somerset Place, Bath; Major Arthur H. Wodehouse, 32, Upper Gloucester Place, Dorset Square, N.W.1. No share qualification required. Remuneration, £100 each per annum (chairman £150). Secretary: R. Elliott. The registered office is at 30, St. Swithin's Lane, E.C.4.

Official Returns of Electrical Companies.

Frank Craft (Castleford), Ltd.—E. V. Williamson, of 7, Greek Street, Leeds, ceased to act as receiver and manager on May 31st, 1927.

Racon Electrical Co., Ltd.—Capital, £100 in £1 shares. Return dated December 9th, 1926 (filed March 8th, 1927). All shares taken up. £100 paid. Mortgages and charges, nil.

Simmonds & Stokes, Ltd.—Capital, £10,000 in £1 shares. Return dated February 14th, 1927. 7,521 shares taken up. £1,521 paid, £6,000 considered as paid. Mortgages and charges at date of return: £3,350. Since issued: £50 debentures on March 29th, 1927.

Martletts, Ltd.—Capital, £6,000 in 5,000 preference shares of £1 each and 40,000 ordinary shares of 6d. each. Return dated December 31st, 1926 (filed January 12th, 1927). 3,002 preference and 40,000 ordinary shares taken up. £1,352 paid (being 9s. per share on 3,000 preference and £1 on 2 preference shares), £1,000 considered as paid on 40,000 ordinary shares. Mortgages and charges, nil.

Cymbal, Ltd.—Capital, £200 in 2s. shares. Return dated December 31st, 1926 (filed March 18th, 1927). 1,000 shares taken up. £100 paid. Mortgages and charges: £163 5s. 3d.

Duff Bros., Ltd.—Capital, £2,100 in 2,000 "A" ordinary shares of £1 each and 1,000 "B" and 1,000 "C" shares of 1s. each. Return dated January 12th (filed April 5th), 1927. All shares taken up. £2 paid, £2,098 considered as paid. Mortgages and charges, nil.

Illuminated Advertising Co., Ltd.—Capital, £1,000 in 500 preference and 500 ordinary shares of £1 each. Return dated March 1st, 1927. 500 ordinary and 478 preference shares taken up. £978 paid. Mortgages and charges, nil.

Philips Lamps, Ltd.—Capital, £50,000 in £1 shares. Return dated June 9th (filed December 6th), 1926. All shares taken up. £50,000 paid. Mortgages and charges, nil.

Electro-Mechanical Supplies, Ltd.—Capital, £3,000 in £1 shares. Return dated January 14th, 1927. 999 shares taken up. £999 paid. Mortgages and charges, nil.

Atmos Electrical Co., Ltd.—Capital, £2,000 in 1,000 preference and 1,000 ordinary shares of £1 each. Return dated December 4th, 1926. 750 ordinary shares taken up. £250 paid, £500 considered as paid. Mortgages and charges, nil.

Luminograph Co., Ltd.—Capital, £1,000 in £1 shares. Return dated January 14th, 1927. All shares taken up. £1,000 considered as paid. Mortgages and charges: £1,500.

Power Securities Corporation, Ltd.—Capital, £2,000,000 in 1,000,000 preference and 1,000,000 ordinary shares of £1 each. Return dated March 2nd, 1927. 500,000 preference and 500,000 ordinary shares taken up. £1,000,000 paid. Mortgages and charges, nil.

Wakelins Wireless Co., Ltd.—Capital, £2,500 in 1,250 ordinary and 1,250 preference shares of £1 each. Return dated December 14th, 1926. 135 ordinary shares taken up. £102 paid. £33 considered as paid. Mortgages and charges, nil.

District Lighting Supply, Ltd.—Capital, £1,000 in £1 shares. Return dated December 31st, 1926 (filed April 28th, 1927). All shares taken up. £1,000 considered as paid. Mortgages and charges, nil.

Read & Morris, Ltd.—Capital, £2,000 in 1,940 ordinary shares of £1 each and 1,200 founders' shares of 1s. each. Return dated December 31st, 1926 (filed March 23rd, 1927). 1,200 founders' shares taken up. £30 paid. £30 considered as paid. Mortgages and charges, nil.

Willet & Robinson, Ltd.—Capital, £7,000 in 3,000 "A" cumulative preference, 1,000 "B" preference, and 3,000 ordinary shares of £1 each. Return dated August 19th, 1926 (filed March 22nd, 1927). 2,000 "A" cumulative preference and 2,000 ordinary shares taken up. £4,000 paid. Mortgages and charges, £390.

Acme Electric Lamp Co., Ltd.—Capital, £1,000 in £1 shares. Return dated June 30th, 1926 (filed April 16th, 1927). All shares taken up. £2 paid. £998 considered as paid. Mortgages and charges, £2,551.

G. S. Hawker, Ltd.—Capital, £1,000 in £1 shares. Return dated April 4th, 1927. 750 shares taken up. £250 paid. £500 considered as paid. Mortgages and charges, £900.

Tungsram Electric Lamp Works (Great Britain), Ltd.—Capital, £100 in £1 shares. Return dated February 28th, 1927. 10 shares taken up. £10 paid. Mortgages and charges, nil.

Electro-Plant, Ltd.—Capital, £1,000 in £1 shares. Return dated December 31st, 1926 (filed April 13th, 1927). Two shares taken up. £2 paid. Mortgages and charges, nil.

Sherborne Electric Supply Co., Ltd.—Capital, £15,000 in £1 shares. Return dated April 7th, 1927. 12,031 shares taken up. £12,031 paid. Mortgages and charges, nil.

Bann Syndicate, Ltd.—Capital, £10,000 in £1 shares. Return dated January 14th, 1927. 8,002 shares taken up. £8,002 paid. Mortgages and charges, nil.

Schall & Sons, Ltd.—Particulars filed of £12,000 debentures authorised June 8th, 1927, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Bordesley Electrical Accessories Co., Ltd.—Capital, £5,000 in £1 shares. Return dated March 4th, 1927. 4,812 shares taken up. £2,500 paid. £2,312 considered as paid. Bank overdraft, £1,509 10s. 9d.

Accumulators (Birmingham), Ltd.—S. R. Worley, of 23, Bush Lane, Cannon Street, E.C., ceased to act as receiver or manager on June 3rd, 1927.

Rose Bros. Electrical Co., Ltd.—T. G. Weavers, of 4, Drapers' Gardens, E.C., was appointed receiver and manager on June 7th, 1927, under powers contained in debenture dated July 1st, 1925.

Whittaker Bros., Ltd.—Capital, £7,000 in 1,000 cumulative, 5,000 "A" ordinary, and 1,000 "B" ordinary shares of £1 each. Return dated December 31st, 1926. 3,907 (class not stated) shares taken up. £3,207 paid. £700 considered as paid. Mortgages and charges, nil.

Liskeard Gas and Electricity Co., Ltd.—Memorandum dated June 1st, 1927, endorsed on debentures dated January 21st, 1926, securing increase in rate of interest from 5 per cent. to 6 per cent.

General Radio Co., Ltd.—Particulars filed of £20,000 debentures authorised June 3rd, 1927, and covered by trust deed of same date, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £15,000 (at 2 per cent. discount). Trustees: Redeemable Securities Investment Trust, Ltd., Broad Street House, E.C.

City Notes.

Callender's Cable and Construction Co., Ltd.

The balance of profit for the year ended December 31st last is £356,525, as compared with £368,644 in 1925. After providing for interest, depreciation, preference dividends, &c., and adding the balance brought forward (£611,338, less £329,022 transferred to reserve), there is a balance of £496,287 available. From this a dividend of 15 per cent. is declared (5 per cent. already paid) on the ordinary shares, leaving £376,287 to be carried forward. An increase of £300,000 in the capital was authorised in June last year; 200,000 shares have been issued as a bonus to the shareholders, leaving 200,000 available for future issue. The company's operations were seriously affected by the general strike and the coal stoppage. The factory was entirely closed for several days, chiefly owing to the failure of the power supply. Subsequent manufacture at Erith was seriously hampered by difficulty in obtaining supplies and by costly and inadequate transport. Consequently there was a small decline from the record profit of 1925, but in the circumstances the directors consider the result satisfactory. The operations at the Anchor Works were less seriously interrupted, as they were able to carry on without cessation of production. They also suffered, however, from increased costs of supplies and transport, and had shown a reduction of profit. The report refers to the passing of the Electricity (Supply) Act and the commencement of operations by the Central Electricity Board, and says that meanwhile several of the existing undertakings are making large developments, and considerable orders have been placed with the company for work thus resulting. Since the beginning of the year there has been a strong and healthy demand for cables and wires, and both the Erith and Leigh factories were well occupied and in excellent condition. It has taken longer than was anticipated to bring the Okonite-Callender Co. of America into full and profitable operation, owing largely to the changed condition of the cable industry in the United States, where new methods and standards have been adopted which have entailed considerable changes in that company's production and policy. In the meantime, however, the company has secured many large contracts and is producing cables of the highest quality of the type and for the pressures now required in America. The directors regret that Mr. A. W. Tait, C.B.E., has, owing to his other engagements, found it necessary to retire from the board. They desire to place on record their high appreciation of the services which Mr. Tait rendered to the company during the period of his association with it. Meeting: June 30th.

W. T. Henley's Telegraph Works Co., Ltd.

The accounts for the year ended March 31st last show a profit of £306,985 (against £311,029 in 1925-26). After providing for debenture interest, depreciation, &c., and adding £503,779 brought forward (less directors' bonus, £2,500), the amount available is £753,055. From this £50,000 is transferred to reserve, and income tax is paid, as well as the preference and interim ordinary dividends, leaving £619,953. The directors recommend a final ordinary dividend of 2s. 6d. per share (making 4s., or 20 per cent., for the year), together with a bonus of 1s. per share. This will leave £506,203 to be carried forward. Satisfactory progress was made during the year, although some inconvenience and additional expenditure were caused by the industrial troubles. The directors do not consider it necessary to increase substantially the amount carried forward, and accordingly recommend the payment of a cash bonus. Sir George Sutton, Bt., has retired from the office of managing director, but continues to supervise the business as active chairman. Mr. A. E. Salmon, who has been for many years secretary of the company, has been elected a director, and will continue to devote his whole time to the service of the company. Meeting: July 1st.

Greenwood & Batley, Ltd.

A final dividend of 2½ per cent. has been declared, making 5 per cent. for the year, as for 1925-26.

Telephone Manufacturing Co., Ltd.

The annual meeting was held on June 17th, Mr. F. T. Jackson (chairman) presiding. In presenting the report and accounts (Electrical Review, June 10th, p. 941) Mr. Jackson said that the balance sheet of the British Installation Companies showed satisfactory results considering the industrial troubles of last year. An increased profit had been earned, and their indebtedness to the company had been reduced by £19,000 to £78,000. The business done by the subsidiaries during the first five months of the current year showed a substantial increase, and that improvement was expected to continue. The effects would not all be felt in the current accounts, for the contracts were spread over a period of years. The Australian subsidiary had now recovered and was earning satisfactory profits. The Continental Companies had also made small profits, and were gradually reducing their indebtedness to the parent company. As so large a contingency reserve was not now necessary, part of it was being used to write off premiums and expenses on the bonds redeemed, and that item was cleared out of the balance sheet. £12,000 had been written off out of profits for obsolete apparatus. The parent company had secured a number of substantial contracts during the year, but their completion was delayed by the general strike, and a considerable volume of orders was carried forward to 1927. Mr. Jackson criticised the short-sighted policy of the Government in delaying telephone development. Competition was very keen in the automatic telephone business, but the company refused to take orders which did not hold out the prospect of a reasonable profit. He condemned the present policy of confiscating surplus revenue earned by the telephone service, stating that it should be used for development purposes, and he considered that the Government was not the proper body to run the system. He suggested an organisation on the lines of the Metropolitan Water Board or the Port of London Authority. Capital could be raised by the issue of telephone bonds at a fixed rate of interest. With the present lack of orders, experienced men had to be discharged, and when work did come a new body of men had to be trained. With regard to the company's future, the chairman said that it seemed as though it would continue to be fairly busy for some time to come. Apart from public telephone work, it had other work which was growing and expanding.

British Empire Trust Co., Ltd.

Addressing the shareholders at the annual meeting on June 14th, Mr. J. Davidson (deputy chairman and managing director) said that they had been able to increase the preferred ordinary dividend from 5 to 6 per cent. and the deferred ordinary dividend from 7 to 8 per cent., and to transfer £100,000 to reserve. The time had come when they could revert to the payment of interim dividends. He proceeded to review the position of the companies in which they were interested. The British Columbia Electric Railway Co., Ltd., he said, continued to expand, and the outlook for the current year was encouraging. The West Gloucestershire Power Co. was similarly situated. Political conditions in Mexico showed little, if any, improvement, but in spite of that the business of the Monterey Railway, Light & Power Co. increased during the past year, and the company was able to continue the payment of interest on its "A" first mortgage debenture stock and provide for the sinking fund relating to that stock. The new Canadian & Foreign Securities Co. should be as successful as the old Canadian Northern Prairie Lands Co. The report of the Canadian Western Lumber Co. was satisfactory. The Winnipeg Electric Co. was favourably placed, and had successfully conducted a customer-ownership campaign. The chairman concluded with a reference to the company's Canadian gas interests.

Whitehall Electric Investments, Ltd.

The report of this company was reviewed in our last issue (p. 985). The annual meeting was held on June 16th, when the Hon. Clive Pearson (chairman), who presided, said that in five years they had written off £695,000 in respect of debenture discount and stamp duties, leaving only £36,766 to be dealt with. After visiting Chile, he (the chairman) was well satisfied with the company's properties. The directorates of the Chilena and Valparaiso companies were confident that they were only at the threshold of the business which lay before them. Excellent progress had been made with the 22,000-kW hydro-electric plant on the Maipo river, and it was felt to be certain that the plant would be in operation by April next. Although Mexican conditions had not improved the companies in which they were interested reported relatively satisfactory results. The company's income for the past two years had been derived as to 80 per cent. from Chile and 20 per cent. from Mexico. He believed that there would be a satisfactory outcome of the present situation in Mexico and that there would be an improvement in income from that source.

Sphere Investment Trust, Ltd.

The report of this company (formerly the United Electric Tramways of Montevideo, Ltd.) for 1926 states that the whole of the company's tramway interests in Montevideo and some other assets have been sold to the Atlas Light & Power Co., Ltd. The outstanding debenture stock was satisfied by 5 per cent. debenture stock of the Atlas Co. The Trust has now no debenture stock outstanding, and possesses 450,000 7 per cent. cumulative preference shares and 500,000 ordinary shares of £1 each of the Atlas Co., with certain other investments. The change of name and the subdivision of the £5 shares were confirmed by the Court in March last. The revenue account for 1926 shows a credit balance of £33,872, taking no account of any final dividend to be declared on the ordinary shares of the Atlas Co. The directors recommend the payment of a dividend of 2 per cent. on the ordinary shares, leaving £1,872 to be carried forward. The retirement of Mr. H. F. Gunning from the board and the appointment of Messrs. D. M. Touche and A. J. Side as directors are mentioned in the report. Meeting: To-day (Friday).

Delhi Electric Tramways and Lighting Co., Ltd.

The combined net revenue of the tramway and lighting undertakings for 1926 amounted to £49,539, as compared with £45,019 for 1925. After crediting profit on exchange, &c., deducting general expenses and debenture interest, and adding £2,142 brought forward, there remains £51,849. The general reserve receives £15,001, depreciation and renewals £14,024, taxation reserve £7,000, and employés' provident fund £585. Dividends of 12 per cent. on the preferred and participating shares and 11.1724 per cent. on the ordinary shares are recommended, absorbing the whole of the available balance. A draft agreement for a bulk supply from the Government generating station is in the company's possession. Mr. A. W. R. Lovering was appointed a director during the year. Meeting, June 28th.

Fellows Magneto Co., Ltd.

The annual meeting was held on June 15th. Mr. V. L. Fellows (chairman) presided and presented accounts covering the two years ended December 31st last. He said that during 1925 the company ceased to make magnetos, and the directors were unable to present a balance sheet until the plant was written off. It was finally disposed of in February last. Since January 1st, 1926, they had established twelve successful provincial branches, and sales were showing a steady increase. The whole of the working capital was now really provided by the bank, which was requiring the reduction of its advances. After some discussion the report was adopted, and subsequently resolutions were carried providing for the reconstruction of the company upon the lines mentioned in our issue of June 10th, p. 941.

New Issue.

Lancashire Electric Light & Power Co., Ltd.—On Tuesday last this company offered for subscription £1,000,000 of 5 per cent. redeemable debenture stock at the price of £95 per cent. The stock is redeemable in 1980 or earlier at the option of the company. The proceeds are to be applied in providing for the purposes of the undertaking, including the erection of a power station at Kearsley and repaying bank advances. The initial plant at the Kearsley station will comprise four 42,000-h.p. sets and provision is to be made for the installation of two further sets. The first portion is expected to be put into operation by the end of 1929. Last year the company had a maximum demand of 80,000 h.p. on a plant capacity of 103,000 h.p.; the amount of energy sold was 146,580,000 kWh. The issue having been over-subscribed many times, the list was closed at 10 a.m. on Tuesday.

Aron Electricity Meter, Ltd.

The accounts for the past year show a net profit of £9,041 (as compared with £11,424 in 1925), and to this is added a balance of £2,942 brought forward, making £11,983. It is proposed to transfer £1,000 to reserve (against £3,000) and to pay a dividend of 6 per cent. on the ordinary shares (the same), leaving £2,376 to be carried forward. Meeting: June 28th.

Ransomes, Sims & Jefferies, Ltd.

The profit for the year ended March 31st last was £18,887 and the addition of £58,599 brought forward makes available £77,486. The directors do not feel justified in recommending the payment of an ordinary dividend, and after transferring £10,000 to reserve propose to carry forward the balance of £56,487.

Stock Exchange Notices.

Application has been made to the Committee to allow the following to be officially quoted:—

London Electric Supply Corporation.—199,800 ordinary shares of £1 each, fully paid, Nos. 499,501 to 699,300.

Pennsylvania Water and Power.—429,848 shares of capital stock of no par value.

Cape Asbestos Co., Ltd.

From the 1926 profits (amounting to £36,766 plus £10,491 brought forward), £15,000 has been transferred to reserve; a dividend of 10 per cent. is recommended on the ordinary shares and a similar dividend on the preference shares. £11,757 is carried forward.

United Water Softeners, Ltd.

Out of a profit of £20,770 for 1926 (against £19,091) the directors are again paying an ordinary dividend of 2s. per share, free of tax. The shareholders are offered, at 15s. each, 36,750 £1 shares in the Buell Combustion Co., which the company has received for its "Kek" interests.

British Electric Traction Co., Ltd.

This company's annual meeting was held on Tuesday last. A report will appear in our next issue.

Kidderminster and District Electric Lighting and Traction Co., Ltd.

The total net receipts for 1926 were £7,545, and to this figure is added £454 brought forward, making £7,999. Of this £1,000 is allocated to renewals, and £800 to reserve. The directors propose to pay an ordinary dividend of 2½ per cent. and carry forward £465. After providing for renewals, the profit of the Kidderminster & Stourport Electric Tramway Co. is £99. This is added to £625 brought in and the whole is carried forward.

Chile Telephone Co., Ltd.

It was reported last week that the purchase of the company's business by the International Telephone & Telegraph Corporation had been completed. The latter has already acquired control of All-American Cables, Inc., and the Montevideo Telephone Co., Ltd.

Guest, Keen & Nettlefolds, Ltd.

The net profit for the year ended March 31st last fell from £948,298 to £909,278. The balance brought forward is £235,639, which makes available £1,144,917. The ordinary dividend is maintained at 10 per cent. free of tax, and £208,451 is carried forward.

Anglo-Argentine Tramways Co., Ltd.

A dividend of 2s. 9d. per share has been declared on the 5½ per cent. first preference shares and one of 3s. per share on the 6 per cent. second preference shares, in respect of the half-year ending June 30th.

James Keith & Blackman Co., Ltd.

The directors report improved business during 1926, the net profit amounting to £35,806, as compared with £25,858 for 1925. The ordinary dividend is raised from 10 to 12½ per cent. and the amount put to reserve from £5,000 to £8,000.

Dorman, Long & Co., Ltd.

The directors have again decided to pass the dividend on the non-cumulative preferred ordinary shares, and consideration of the payment of the dividend on the cumulative preference shares is postponed.

Lancashire Dynamo and Motor Co., Ltd.

The holders of the company's debentures are being asked to agree to the postponement of the redemption date for 20 years from June 30th. In consideration of this it is proposed to raise the rate of interest from 5 to 6 per cent.

International Light and Power Co., Ltd.

A dividend of 3 per cent. (less British tax) has been declared on the preference shares in respect of the half-year ending June 30th.

Falkirk Iron Co., Ltd.

From the 1926-27 profits the directors propose to pay a final dividend of 5 per cent., making 10 per cent. for the year as for 1925-26. £10,000 is placed to reserves and £35,596 carried forward.

Lisbon Electric Tramways, Ltd.

The half-yearly dividend has been declared on the 6 per cent. cumulative preference shares.

Swedish-Mexican Company.

The report for 1926 of the *Mexikanska Telefon a.b. Ericsson* states that development proceeded very satisfactorily. Hitherto the company has only carried on the telephone business in Mexico City and environs, but during 1926 an interurban concession was granted for the whole of the republic and for the installation of telephones throughout the country. In order to finance this extension, which has already begun, the share capital has been increased from 5,400,000 kr. to 10,800,000 kr. The net profits are returned at 1,127,000 kr., as compared with 970,000 kr. in 1925, and the dividend is 10 per cent. on the increased capital, as against 12 per cent. on half of this capital in 1925.

German Company.

The *Accumulator Works Company*, Berlin-Hagen, reports that the stagnation in sales in 1925 continued in the first half of 1926, but in the second half a revival took place in automobile and radio batteries. The turnover in large stationary batteries continued to be unsatisfactory. The export business did not improve, and only the hope of better times justified the maintenance of the export organisation. The accounts show net profits of 1,991,000 marks, as compared with 1,929,000 marks in 1925, the dividend remaining at 8 per cent. on the share capital of 20,000,000 marks.

French Companies.

The *Etablissements Gaiffe-Gallot et Pilon* report net profits of 1,727,000 fr. for 1926; the dividend is 60 fr. per share.

The *Société l'Appareillage Electro-Industriel* (*Petrier Tissot et Raybaud*) has decided to pay a dividend of 20 fr. per share out of net profits of 770,000 fr. for 1926.

The *Compagnie Lorraine de Charbons, Lampes et Appareillages Electriques* records net profits of 691,000 fr. for 1926; the dividend is 15 fr. per share.

Stocks and Shares.

Monday Evening.

When Money Matters.

With the near approach of the end of June, it is usual for money conditions to become a little strained, owing to the ordinary seasonal requirements for window-dressing and other purposes. Banks and private firms who have had money out on loan sometimes make the end of June, as they do the end of the calendar year, a convenient peg upon which to hang requests for repayment, and to curtail facilities which would be in the ordinary way granted with little hesitation. Experience looks for tightening of money rates at this time of the year, a tendency that reacts, of course, upon Stock Exchange prices, more particularly those of the gilt-edged variety. Speculative stocks and shares are less influenced by purely financial considerations, though in their case, as in that of the investment securities, the contraction of contango facilities serves to check enterprise on the part of those who look to such assistance for the financing of their commitments.

Brazilian Tractions.

In view of the enormous amount of new capital which has been issued for public subscription during the past few months, and the fact that a good many of the recent comers are still partly paid, the firmness of Stock Exchange markets as a whole is significant of the public's willingness to invest money and of their ability to pay for their purchases. Brazilian Tractions continue amongst the liveliest of the speculative counters, and, although the price has gone back 8 points to 167, this reaction is comparatively trifling in view of the extraordinary rise that has taken place in the shares over the past three months. No fresh developments have been reported from the company, but the market is wedded to the idea that, before long, there will be some kind of bonus, in addition to an increase in the present dividend rate of 6 per cent. per annum. The preferred shares have moved in consonance with the common shares, and are down 7 points at 146.

Ex Dividend Recoveries.

British Electric Traction ordinary has gained another 2 points at 153, there being a steady pressure to buy the stock and a small amount of floating supply on offer in the market to meet the demand. The 6 per cent. preferred has risen to 121½. No changes have occurred in the London group of traction issues. Districts have gone ahead to 63½. A good many stocks and shares are quoted ex the interest and dividends due at this time of the year, amongst these being both classes of Anglo-Argentine Tramways preference and British Columbia Electric preferred and deferred. The disposition is for dividend deductions to be recovered, at any rate in part, almost as soon as they are taken off the prices, from which it is evident that when the quotations are marked ex, the yield on the reduced valuation attracts prompt attention and leads to inquiries for the stocks and shares affected.

New Issues.

New issues continue to make their appearance, though at a slower rate than has recently been the case. The Lancashire Electric Light and Power Company has been offering 5 per cent. debenture stock at 95, a well-secured investment and one that is likely to appeal to the buyer of sound industrial issues. The stock made its appearance under auspices which suggest that, as soon as the stags have completed their operations and the market has settled into a normal condition, there is likely to be a premium of a point or two as the stock becomes absorbed by hands that will hold it permanently. The West Midlands Joint Electricity Authority has been offering two million pounds 5 per cent. stock at 98, of which a quarter is to be allotted fully-paid in part payment of properties to be acquired, and the other 75 per cent. was available for public subscription. The Authority will operate in an area covering a thousand square miles in Staffordshire, Shropshire and Worcestershire, and at the outset will possess generating plant which last year produced nearly 125 million kWh. The first interest payment is one of 12s. 6d. per cent., due in October this year. Redemption at 100 will take place in 1968 or any time after 1948 at the same figure. Underwriters were left with 60 per cent. of their obligations, and the price of the scrip is 1 discount.

London Electrics.

Competition from these newcomers affected the price of the new County of London Electric 5 per cent. debenture recently issued at 96. The premium diminished to about ¾, at which price the stock is obtainable in the market free of stamp and fee, to give £5 3s. per cent. on the money. The first interest payment is one of 28s. 1d. per cent., payable in December this year. No changes occurred in the price of Lancashire shares, which remain at 26s. middle, but Notting Hill preference, which so rarely move, put on 5s. to 10¼, upon a small demand. Edmundsons improved upon their last week's rise, going ahead to 29s. 6d., and the company's preferences strengthened to 24s. Bournemouths parted with a portion of their improvement, coming on offer at £3 a share. No movements of importance have occurred in the London group, a drop of 6d. in City Lights to 27s. being balanced by an advance of the same amount in Kensingtons to 25s. 6d. Yorkshire (West Riding) preference strengthened to 13s. 9d.

The Telephone Octopus.

It was announced from Santiago last week that the sole ownership of the Chile Telephone Company has been acquired by the American International Telephone and Telegraph Corporation as the result of negotiations in London. These negotiations, it need scarcely be said, have been reflected in the steady rise which has lifted the price of Chile Telephones to 7⅞, at which the yield on the money, on the basis of the last dividend, is a meagre 3⅞ per cent. The American International Telephone and Telegraph Corporation is a keen buyer of telephone companies throughout South America, and not long ago acquired control of the Montevideo company. Lately, the remarkable advance in the price of United River Plates has been ascribed to purchases made for the probable purpose of obtaining control by the same omnivorous corporation. The United River Plate report showed an increase of £50,000 on the company's profit last year, to £455,000. The company's meeting, held on Tuesday in this week, was awaited with great interest, it being expected that the chairman would make some reference to the presumed angling by the American concern for the United River Plate company.

Telephony at Home.

Telephone Manufacturing shares, which had a severe fall earlier this month on the issue of a report that was disregarded as disappointing, have been a firmer market round about 7s. The shares are of the nominal value of 10s. each, and the company, having recently paid off its debentures, was expected to be able to declare a modest dividend on the ordinary shares in respect of the year recently ended. This, however, as already mentioned, the directors were unable to recommend. At the meeting last Friday the chairman accused the Government of curtailing expenditure in a Department, that is, the telephone, which is not only revenue-producing, but of importance in assisting revival in trade. He maintained that the telephone service should be handed over to a body run on similar lines to the Metropolitan Water Board or the Port of London Authority, with a man at the head of it who shall be the best business man obtainable, regardless of salary. Additional capital for the telephone service, he argued, could be obtained from the investing public in the shape of telephone bonds. It has long been a matter for criticism, of course, that this country should lag behind other parts of the world in the provision of cheap and efficient telephony. Automatic Telephones are steady at 47s. 6d., and Internationals remain at 39s. 6d.

Wireless.

The rise in Marconis suffered a sharp check, as mentioned last week, upon the opposition that has redeveloped in connection with the arrangements that the directors desire to make in connection with placing the capital account upon a sounder basis. Marconis went back to 20s., but Canadian Marconis, which rumour declares to be the object of desire to the Radio Corporation of America, keep up steadily at their advanced price of 5s. 6d. Other wireless shares are quiet. India-Rubber, Gutta-Percha shares have fallen 2s. 6d. to £1, in consequence of the announcement that no interim payment will be paid on the ordinary shares.

"Dollar" Stocks.

Henleys hold their substantial advance at 4¾, on the increase in the dividend and the important contracts which the company has just secured from the Great Indian Peninsula Railway and the Eastern Telegraph Companies. Whitehall Electric preference remain at 20s. 6d., being a rather better market on the statement by the Hon. Clive Pearson at last week's meeting to the effect that 80 per cent. of the company's income has been derived from Chile and rather under 20 per cent. from Mexico. This sets at rest the doubt which had been felt in regard to the amount of the stock which the Whitehall company possesses in Mexico. The chairman declared his belief that the Mexican Government realises that recent legislation is detrimental to the well-being of the country, which, with its population of 15 millions and great resources, feels the vital necessity for the development which electrical power offers. Mexico Tramways common shares are 2 better, at 26. Amongst other "dollar" stocks, St. Maurice Power 6½ per cent. first debentures are 3 higher at 105. Quebec Power 6 per cent. "A" debentures hardened to 105½. Shawinigan common have gone back to 89½.

Points.

Lisbon Electric Trams rose to 21s. 6d. on the declaration of a 3 per cent. dividend, making 6 per cent. for the year, and the pleasant surprise of a 50 per cent. bonus in £1 ordinary shares through application of £317,000 of the reserve. The company's ordinary shares had been out of the dividend list since 1916 until six months ago, when an interim dividend of 3 per cent. was paid. The Aron Electricity Meter repeats the 6 per cent. dividend on its ordinary shares, the price of which is 16s. 6d. The newly-issued Electric Finance preference are steady at 1s. 3d. premium, and the Newcastle-on-Tyne new shares attract a good deal of business on the basis of 9d. to 1s. premium. Rubber shares enjoyed a little burst of strength on the Government's announcement that it did not contemplate removal of the Stevenson Restriction scheme. The hopefulness so engendered was chastened by a further fall in the price of rubber to 1s. 4½d. per lb.

Our Foreign Electrical Trade.

Electrical Exports and Imports during May, 1927.

THERE was a satisfactory rise in our electrical exports during last month, although as regards the individual items, increases and decreases were equal in number. The principal increase occurred in the case of unenumerated electrical machinery, which was over £66,000 above the April total. Insulated wires and cables also improved, to the extent of £51,564, while important rises were recorded for the other two machinery classes—railway and tramway motors and "other" motors and generators. The exports of unenumerated electrical goods and apparatus showed the greatest fall; the other decreases, apart from that of £16,222 in submarine cables, were not of very great dimensions. As was to be expected, the comparison with May last year shows a heavy increase. On account of the general strike, the exports during May, 1925, reached a low level, though not so low as it might have been. There was, however, one substantial decrease last month, *i.e.*, the fall of £33,516 in telegraph and telephone instruments and apparatus. A decrease in meters and instruments is also to be noted.

The following figures show the distribution of exported electrical machinery:—

Destination.	May, 1926. £	May, 1927. £	Inc. or dec. £
European countries	58,528	104,870	+46,342
Japan	24,475	21,781	− 2,694
South-American countries ...	25,063	69,806	+44,743
South Africa	54,059	99,884	+45,825
British India	91,457	89,567	− 1,890
Australia	90,430	101,295	+10,865
New Zealand	31,779	30,655	− 1,124
Canada	10,991	34,112	+23,121
Other countries	38,401	55,572	+17,171
Totals	£425,183	£607,542	£182,359

The import section was affected to a greater extent by the general strike, and there was an increase last month in every section as compared with May, 1925, while the total increase was proportionately very large. Unenumerated electrical machinery was the class showing the greatest rise. Comparing the figures with April last, it is seen that unenumerated machinery again led the list of increases. There were only three classes which showed a reduction—unenumerated goods and apparatus, insulated wires and cables, and telegraph and telephone apparatus.

The dwindling tendency shown by re-exports continued during May, although, naturally, they were higher than in the corresponding month of last year.

The totals for the completed portion of the year are of a favourable nature, but the imports have risen in greater proportion than the exports.

Remotely-controlled and Automatic Plant.

Some particulars are given in a recently-issued bulletin of Messrs. Oerlikon, Ltd., of the new hydro-electric generating station which has been erected at Ranconniere, Switzerland, for the supply of power to Le Locle, about two miles away. The plant presents the special feature of being controlled automatically, both on the hydraulic and the electrical sides. Two Oerlikon sets, one 500- and one 350-kVA, are installed, and the station is linked up to the Le Locle distribution station, working either alone or in parallel with the neighbouring system. The generators are synchronous induction machines. The governor regulators and the turbine governors are remotely controlled from the Le Locle distribution station, where a secondary regulator is also provided for automatic pressure regulation. Provision is also made for the automatic closing down of the plant in the event of a fault in the pilot cables, racing of the turbine, too great an overload, or excessive heating of the vital machine parts. Details of an interesting outdoor substation which has lately been erected at Berthoud, Switzerland, by the Bernese Power Supply Co., are also given. It serves to step down the pressure from 45,000 V to about 17,000 V, and at the same time to keep the pressure between given limits by regulation. The plant consists at the present time of one 6,000-kVA transformer-induction regulator equipment; provision has, however, been made for two or three further regulators to be installed at a later date. Both the transformer and induction regulator are of the oil-immersed self-cooled type, the transformer being provided with stacks of cooling tubes, while the induction regulator is in an ordinary corrugated iron tank and is designed for regulating the pressure between 14,400 and 17,600 V; it is operated, under normal conditions, automatically by means of a motor controlled by a quick-acting pressure regulator. The motor is arranged in a separate casing on the side of the regulator. The whole operating gear is enclosed and designed so as to meet the special conditions imposed by outdoor mounting.

South African Electrical Trade.

Figures for 1925 and 1926 Compared.

THE following statement, showing the imports of electrical and similar goods into the Union of South Africa during the year 1926, has been compiled from the recently-issued official trade statistics. The figures for 1925 are added for purposes of comparison, and notes of any increases or decreases are made.

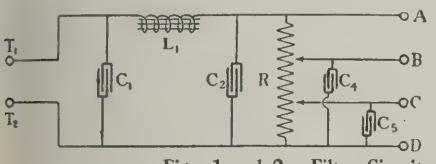
Radio Battery Eliminators.

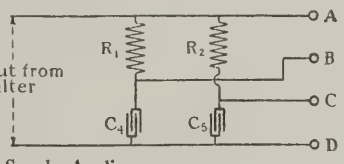
Appliances for the operation of broadcast radio-telephone receiving apparatus by energy derived from the domestic electricity supply mains.

By P. R. COURSEY, B.Sc., M.I.E.E., and H. ANDREWES, B.Sc., Graduate I.E.E.

(*Abstract of paper read before the* WIRELESS SECTION *of the* INSTITUTION OF ELECTRICAL ENGINEERS.)



THE modern radio-telephone receiver has to be energised from three distinct sources of sensibly steady direct current, namely :—



(i) High tension, usually between 45 and 150 volts, and a few milliamperes only are generally required; pressures lower than 45 V are sometimes needed, while more than 150 V is called for by some receiving sets, such higher voltages being very desirable in many cases, but only used as a rule when suitable appliances, other than batteries, are available.

(ii) Low tension, 2, 4, or 6 volts, and a current not exceeding from 1.5 to 2 amperes usually suffices.

(iii) Grid bias, up to about 20 volts, and almost infinitesimal current.

Large-capacity by-pass condensers are usually connected across the h.t. and grid-bias supply terminals; they provide a

Figs. 1 and 2.—Filter Circuits for H.T. Supply Appliances.

means of reducing the accidental, or unavoidable, coupling between various stages of a multi-valve radio receiver, and the possibility of a higher internal impedance in these appliances renders the presence of these by-pass condensers all the more necessary for stable operation.

H.T. D.C. Appliances.—The essential elements of an appliance for use on a d.c. circuit are sketched in fig. 1, which combination acts as a filter to suppress currents of the higher frequencies: the first condenser C_1 by-passes a proportion of the ripple frequencies, since the reactance of the condenser falls for increasing frequencies; the choke L_1 offers an impedance to these ripples, which increases with the frequency, thus allowing only the lower frequencies to pass through to the second condenser C_2 which offers a further selective action similar to the first condenser C_1. The general form of this filter is of the well-known " low-pass " type.

The full voltage across C_2 is obtained from A and D to which the radio set may be connected; with a 200-240-volt supply at least 200 volts is usually available at these output terminals, the difference being the voltage-drop due to the resistance of the choke. Most radio apparatus, however, requires one or more lower voltages in addition to the full output voltage, which may be obtained by a potentiometer across A D such as is indicated by the resistance R in fig. 1, with the two (or more) tapping points connected to the terminals B and C. It is desirable to connect additional condensers (of at least 1 μF capacity) across the additional voltage tapping points, as shown at C_4 and C_5, to provide additional smoothing, but more important is their action in preventing excessive coupling between valves when more than one valve stage is operated from any one tapping point. If the condensers were omitted the varying anode currents drawn by each valve of the radio receiver would be forced to travel through a portion at least of the resistance R, producing across its terminals a voltage-drop of the same frequency, which would in consequence be communicated to the remaining valves in the receiver. Low-frequency oscillations (" howling ") would then be very liable to occur. The low impedance offered by the by-pass condensers C_1 and C_5 to the passage of alternating currents effects a considerable diminution of the voltages available for producing such feed-back effects. It is for this reason also that the capacity of the output condenser C_2 must likewise be large; a minimum capacity of 2 μF is customarily used, but larger values are desirable. A very frequently used arrangement omits the portion of the potentiometer between the tapping point and the h.t. negative terminal D, which modification is shown in fig. 2. This arrangement is simpler and has the additional advantage of somewhat reducing the coupling between different valves, since the total h.t. current is subdivided through different resistance; it results, however, in somewhat greater voltage variation of the tapping points B and C with changes in the load current drawn by the valves.

If a potentiometer arrangement is used, R needs to be high, or it will draw too large a current through the filter. Normally the resistance of the chokes L_1 and L_2 is much in excess of 1,000 ohms, in order to obtain a large inductance in a small space and at a reasonable cost, so that only a few milliamperes can be drawn through the filter without causing excessive voltage-drop. For this reason also the method of fig. 2 is advantageous as it makes a smaller demand upon the filter. Convenient values for R_1 and R_2 are between 10,000 and 100,000 ohms.

H.T. Filter.—With a rectifier, the percentage ripple remaining superimposed on the resulting unidirectional voltage depends upon the output (load) and on the capacity of the smoothing condenser; the larger the condenser the smaller is the ripple voltage.

When, however, a d.c. feeds the filter, the amplitude of the ripple voltage on the system is determined by the generators, &c., on the system, usually of large power capacity, so that the amplitude of the ripple voltage is not very much (if at all) affected by connecting a condenser C_1 across the circuit. The three important factors are :—

(1) The internal resistance of the choke windings as affecting the " regulation " of the apparatus on load.

(2) The resonance, or " pass," frequency of the filter as controlled by the inductance of the choke and the capacity of the condensers, and as affecting its efficiency in removing " hum."

(3) The output impedance of the filter at audio frequencies, as controlled mainly by the capacity of the output condenser of the filter, and as affecting the load which may be drawn from the filter without producing oscillation between the stages of the receiver.

Improvement of all three factors invariably increases the cost of the apparatus. The choke coil and output condenser should be as large as possible, consistent with reasonable cost of the complete appliance, but at the same time the resistance of the choke coil should not be unduly increased to obtain a very high inductance, or the output of the filter will thereby be impaired. Increasing the condenser capacity is therefore of more value than increasing the choke inductance, especially as it also reduces the a.c. impedance of the output circuit. It would appear desirable that the resonant frequency of these two components should be as low as possible, and in any case, if the filter is to be used with an a.c. rectifier, this frequency

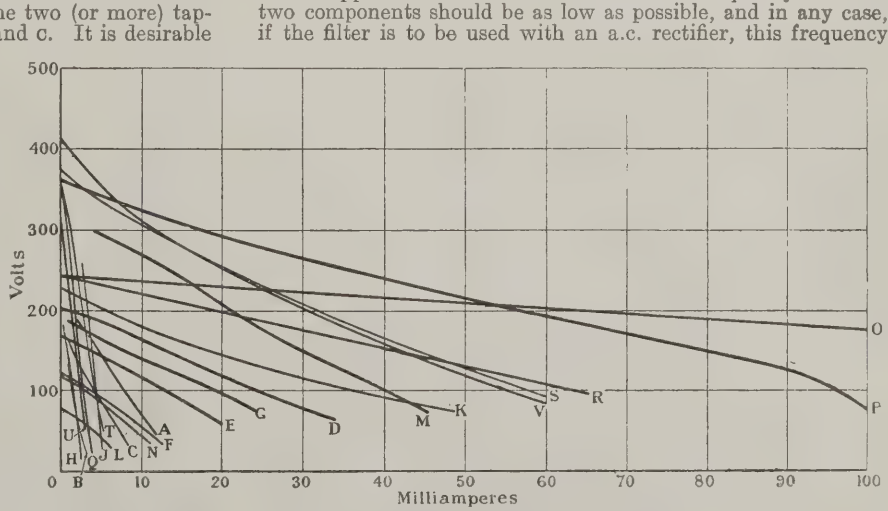


Fig. 3.—Output Characteristics of Commercial H.T. Appliances.

must be below 50 cycles per second. In order that the filter shall be reasonably efficient at this frequency, its resonant or " pass " frequency should apparently not exceed 25 cycles per second. Some curves show a subsidiary " hump " which might have a serious effect on the efficiency of the filter, particularly if it should occur near 50 or 100 cycles; this possibility emphasises the desirability of plotting the frequency characteristics of any filter that it is proposed to use.

Ripple Voltages.—The magnitude of the a.c. ripple in the output circuit permissible without serious effect upon the

quality of the sounds emitted depends upon the design of the receiver itself. Usually the greatest source of disturbance in the receiver is the detector valve; with a given ripple voltage in the h.t. supply to the receiver the intensity of the hum heard in head-phones used with a single detector valve appears to be very much the same as when one or two low-frequency amplifying stages are added and a loud-speaker is used. Over the usual acoustic range of frequencies it appears that approximately equal disturbance is produced by a given ripple voltage, whatever its frequency may be. The result is also affected by the sensitivity of the telephone or loud-speaker at different frequencies, and by the linearity or otherwise of the output of the amplifier with varying frequency. The above statement is therefore likely to be less true with transformer-coupled than with resistance-capacity-coupled amplifying stages. Satisfactory results may usually be expected if the ripple voltage is of the order of 0.1 volt in the h.t. circuit; even with comparatively weak signals 0.2 volt of ripple is not particularly noticeable, except during silent periods of the transmission.

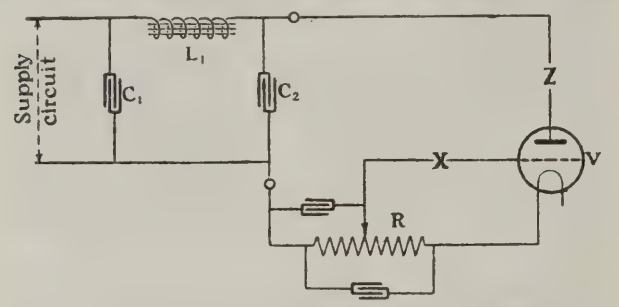

Fig. 4.—Method of Deriving Grid-bias from H T. Appliance.

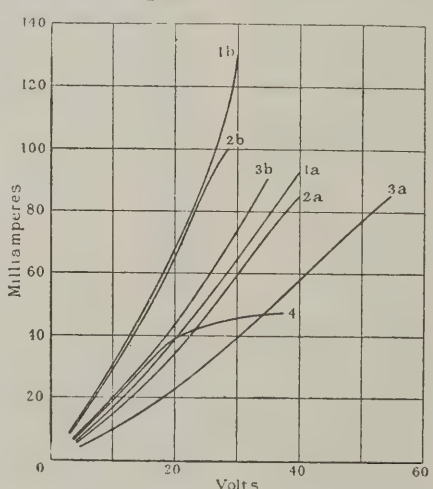
Rating.—At present there appears to be no definite method of rating these appliances so as to express their output; it is suggested that two or three of the following characteristics might suffice for the purpose:—

(1) The percentage regulation of the output voltage at a stated output current, *e.g.*, 1 mA; this quantity = 100 × voltage-drop at 1 mA output/initial voltage at zero output.

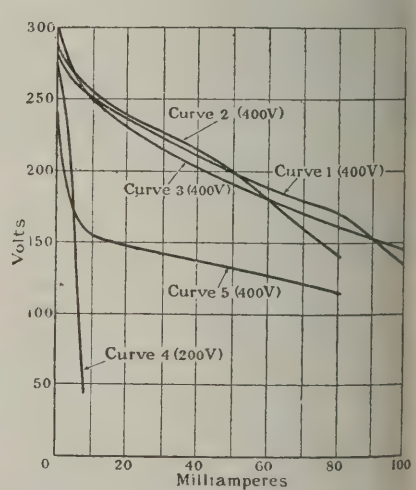
(2) The internal impedance of the appliance expressed in ohms; this quantity = 1,000 × voltage-drop/load current, in mA.

(3) The useful output, expressed in mA for a fixed permitted voltage-drop, say, 33⅓ per cent. from the initial voltage.

(4) The audio-frequency impedance of the output circuit of the appliance measured at some stated frequency, *e.g.*, 500 cycles per second.



Some idea of the extent of the variation of these quantities for a number of commercial appliances may be obtained from the curves forming fig. 3.



Grid-bias Supply.—A grid-biasing supply from the h.t. appliance itself may be obtained by the insertion of a resistance in series with the negative return lead to the appliance, so that the negative terminal of the supply circuit is more negative than the valve filaments of the radio receiver. A portion of the voltage-drop along the resistance R (fig. 4) can then be used for grid bias, in much the same way as this method has been employed in certain radio receivers and amplifiers to provide the necessary grid bias automatically.

The resistance should be shunted by additional by-pass condensers as shown in the diagram; only one valve V of the receiver is shown and additional grid-bias voltages for other stages in the receiver can be provided if required by additional tapping points on R. The disadvantage of the method is that, since R is in series with the common h.t. supply circuit, if the by-pass condensers shunting it are too small in capacity, there is serious risk of "howling" by reason of inter-stage coupling; the by-pass condensers should preferably be of at least 1 μF each.

H.T. Rectifier Arrangements.—The thermionic valve is customarily utilised as a rectifying means to supply the filter when the appliances are required to operate on a.c. circuits. Any of the more usual types of "receiving valves" may be used for this purpose, preferably by connecting the grid and anode together so as to lower the impedance of the valve; even so, however, the impedance is high enough to account for the limited outputs and poor regulation of some of the eliminators of which the output characteristics are reproduced in fig. 3. Special valves marketed for this particular purpose usually have a low internal impedance to enable them to be used on low-voltage circuits (200-220 volts); for double-wave rectification in the single bulb either two anodes co-operating with a single filament may be used, or two filaments insulated from each other and co-operating with a single anode. In fig. 5 two sets of emission characteristics are plotted, those marked 1a, 2a and 3a being the curves for double-wave rectifiers when only one half is in use (as for single-wave rectification), and are therefore comparable with curve 4, which corresponds to a single-wave rectifier valve; curves 1b, 2b and 3b, show the total emission characteristics of the corresponding valves when both halves are in use.

One or two special valves are now also available in which rectification takes place by means of a species of glow discharge in a rarefied gas; one at least of these functions without any heated cathode and such an arrangement represents a considerable saving in the energy required to operate the complete appliance. Rectification characteristics, including a representative of the above-mentioned special types of valve (curve 5) in addition to those given in fig. 5, are plotted in fig. 6* and represent the output of unidirectional current which can be obtained from them, and the fall in voltage occasioned by increase in the d.c. load current. The internal resistance of these valves varies considerably, not only as between one valve and another, but also in the same valve with different load conditions, the latter being particularly noticeable in the case of curve 5 in fig. 6. It is desirable that the internal resistance should be low, not only in order to improve the regulation and output, but also to reduce the percentage ripple. It is desirable also that the total emission should, in general, be not less than about 100 mA.

Figs. 5 and 6.—Emission and Rectification Characteristics of Special Valves.

L.T. Appliances.—When the available system is direct current, the provision of an l.t. supply to the receiver is comparatively simple, but far from economical, since the current utilised at 4 to 6 volts must be paid for at the supply circuit voltage; the latter may be 250 volts, in which case the efficiency of the arrangement cannot exceed about 2½ per cent., while the remaining 97½ per cent. of the energy taken from the mains must be wasted as heat in the series resistance.

A simple series resistance for heating filaments will produce disturbances in the receiver unless a filter is used, and must be connected to the positive pole of the supply circuit, irrespective of whether or not this is the "live" side; if this is not done, it becomes impossible to obtain the h.t. supply from the same mains circuit. A filter circuit on similar lines to the h.t. filter would be possible, but it would be bulky and costly. In fig. 7 three filtering circuits suitable for l.t. supply are shown; probably the most useful arrangement is provided by a floating battery connected across the l.t. circuit, which is really an adaptation of the shunting resistances, since the batteries merely provide a very low-resistance shunt through which the ripple currents can flow, while the back e.m.f. of the battery prevents unnecessary wastage of energy from the supply circuit. An appropriate series resistance in the supply circuit must be added in a d.c. circuit so as to drop the excess voltage, while for a.c. rectification can be effected at low voltage using a step-down transformer. Even a single floating battery with a simple series resistance provides reasonably effective filtration in most cases, and the resistance should preferably be given such a value that there is a slight balance of current in the direction to charge the battery. The valves used for h.t. supply are in most cases unsuitable for providing sufficient current for the l.t. supply; generally the only available rectifiers are the electrolytic, gas discharge tubes, or solid chemical types, which can provide 1 ampere or over. A true "battery eliminator" has yet to be devised, with the result that the more usually adopted arrangement, particularly for a.c. circuits, is a "trickle charger."

Substitutes.—New valves have recently been developed (patented in 1914) in which the heating of the cathode is effected by means of an internal heating element designed to operate directly off the high-voltage supply mains, or at a low voltage provided by a transformer if the supply is alternating current. Two other solutions of the problem differ markedly from the arrangements so far dealt with; while meeting the requirements to some extent, however, they have disadvantages which have prevented their adoption on any wide scale.

*Curve 4 relates to a single-wave rectifying valve and is consequently plotted at half the total voltage applied for the other curves. All curves were taken with a smoothing condenser of 8 μ F capacity connected across the d.c. load.

The first entails the use of a special generator driven by any convenient motive power, or by a low-voltage accumulator (provided with smoothing means to reduce the ripple) to provide both h.t. and l.t. supplies to the radio set. The second makes use of thermo-electrically generated voltages, the energy being obtained from any convenient heat source, but the method has not been practically utilised to any appreciable extent.

Precautions.—With many of the commonly used arrangements dealt with there is direct electrical connection between the radio apparatus and the supply mains; precautions must therefore be taken to avoid risk of shock or dangerous short-circuits. The danger of shock is to a great extent exaggerated, but that due to burns, or perhaps fire, may be more serious, chiefly because the supply of energy is maintained from the mains, whereas dry batteries or accumulators would soon be discharged under heavy load conditions.

The main risk of serious short-circuit arises from the fact that most supply circuits are earthed at some point of the system, while an earth connection is also needed by many radio receivers. The insertion of a suitable insulated condenser into the normal earth connection of the radio receiver will not interfere with its normal radio operation, but will obviate any risk of short-circuit; the circuit to which they are connected should of course be properly fused to guard against ordinary insulation failure in the appliance itself. Condensers in the filter circuits, as well as the above-mentioned earthing condenser, should comply with the newly issued British Engineering Standards Specification (No. 271, 1926), when the circuit voltage is in the neighbourhood of 200 volts. When the appliances are used on a.c. circuits, the use of double-wound transformers in the rectifiers should provide adequate protection against short-circuits from the supply mains, provided that the insulation of such transformers is of reasonable quality. The Wiring Rules Committee of the Institution of Electrical Engineers has under consideration a regulation dealing with these matters.

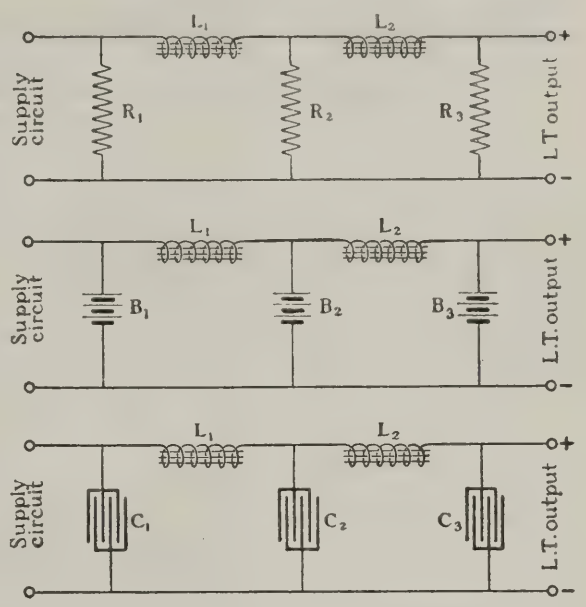


Fig. 7.—Filter Circuits for L.T. Supply Appliances.

Mixed-Pressure Colliery Turbines.

A comparison between the capital outlay and annual cost of high-pressure and mixed-pressure steam turbines for electric power production for colliery use.

(*Review of a paper read before the* Association of Mining Electrical Engineers.)

MANY colliery winding engines are steam driven and exhaust freely to the atmosphere. The steam thus exhausted may be utilised to drive a mixed-pressure turbo-generator set for the production of electricity, and under certain conditions this may be a very attractive proposition; in some cases, however, it may be more economical to install a high-pressure turbine and to disregard the low-pressure steam available.

At a recent meeting of the London branch of the Association of Mining Electrical Engineers, Mr. W. F. Bishop (branch president) occupied the chair, when Mr. C. H. Naylor compared the two above-mentioned schemes: assuming a 750-kW turbo-alternator installation, he indicates that the initial cost of h.p. plant will be £10,198 and that a m.p. set will cost £3,178 more; the difference in capital outlay will bear an annual charge of £435.

Assuming that l.p. steam is available for eight hours per day for 300 days per year; coal of 12,000 B.th.u. to cost £1 per ton; a boiler efficiency of 70 per cent.; full-load output for eight hours and half-load for 16 hours per day, if sufficient l.p. steam is available for full load on the turbine, the h.p. set will cost £4,620 per annum, and the yearly saving in favour of the m.p. set will be £1,345. If sufficient l.p. steam is available for only half load, the saving in favour of the m.p. set will not exceed £43. If the winding engines do not operate and it becomes necessary to drive the m.p. set with h.p. steam, there will be a loss against the m.p. set of £1,025.

The figures thus show that it is not worth while installing a m.p. set in preference to a h.p. set if the l.p. steam available is not more than sufficient for half load. However, the author's results are based entirely on his assumed operating conditions, and each case therefore needs to be examined on its merits; his paper is intended to outline a method of doing so.

Discussion in London.

Mr. Humphrey M. Morgans pointed out that the author had said that turbo compressors could be made of a capacity down to 2,000 cu. ft. per minute, and he (Mr. Morgans) wondered if the performance of a compressor of such a capacity would compare with that of a good reciprocating compressor. He also mentioned the effect of placing condensers alongside the turbines instead of beneath them, having in mind a case in which condensers were arranged alongside the turbines, the latter exhausting from the top, a horizontal pipe going to the condensers, and it had been said that by that arrangement nothing had been lost in vacuum, but that a lot had been saved in connection with foundations. Generally speaking, he believed the use of mixed-pressure turbines in this country would decrease: a colliery steam winder which was using unknown quantities of steam offered a good chance for making economies by putting in a mixed-pressure turbine, but if the management turned out the steam winder and put in a high-pressure turbine and an electric winder instead it would do much better in most cases.

Mr. C. H. Naylor replied that it was much more convenient to situate the condenser below the turbine, and it was only when there were difficulties in connection with the sinking of foundations, or something of that kind, that the condensers were placed on a level with the turbines. A steam winder having a steam consumption of about 40 lb. per brake h.p. was about the best one could get, and such a winder compared favourably with electric winding for any given colliery, but it did not compare favourably with electric winding in the case of a group of collieries.

Mr. McShea emphasised the importance of considering the effect of back pressure on the primary engine, allowing an extra 5 lb. back pressure in the exhaust main for each engine. On the whole he considered that the effect on the cost of running the primary engine, as the result of putting a mixed-pressure turbine on the end of it, was to increase that cost from 5 to 20 per cent., according to the type of primary engine and the conditions under which it was running; that should be debited against the mixed-pressure turbine. The improvement in the prospects of electric winding made it very doubtful whether the use of the mixed-pressure turbine could be justified at all nowadays, except in purely exceptional cases.

Mr. C. H. Naylor replied that the loss was not more than about ½ lb. when a steam accumulator of the gasometer type was used, so that one had not to debit the winding engine very greatly in that case.

Captain A. C. Sparks (in a written communication) referred to the author's statement that the mixed-pressure set obtained low-pressure steam for nothing; presumably the whole of the cost was transferred to the winders, which appeared to be the only source of low-pressure steam suggested. That appeared hard on the winder, which, in any case, would have a larger steam consumption when working in conjunction with a mixed-pressure set, owing to increased back pressure; he suggested, therefore, that some charge must be made to the mixed-pressure set.

Mr. C. H. Naylor pointed out that before a mixed-pressure turbine was installed, the steam was discharged into the atmosphere, but he agreed that back pressure against the winding engines was incurred, and that that should be debited against the mixed-pressure turbine.

Mr. C. H. Roddis referred to a case in which there had been rapid erosion of turbine blades, which was thought to be due to water, but the erosion ceased when de-aeration plant was installed.

Electrical Measurement of Temperature.

A Comparison of the Thermo-Electric and Resistance Methods of Pyrometry employed in Industry.

By J. HALL, B.Sc. (*Résumé*)

IN a paper on "Thermo-Electric and Resistance Pyrometry in Industry," read before the Society of Chemical Industry, Chemical Engineering Group, the author describes the methods of measuring temperature in industrial practice by means of resistance thermometers and thermocouples. A review is given of the theory of the thermodynamic scale, leading up to its reproduction for the methods referred to. In a typical example of a platinum resistance thermometer, the fundamental interval is shown to be as nearly as possible 1 ohm, a convenient value in ordinary commercial practice, though for work of the highest precision a fundamental interval of about 10 ohms is preferable.

Two methods of eliminating the resistance of the leads connecting the thermometer with the bridge are considered; the compensating-lead method devised by Callendar, and that employed in the "distance thermometer" used at lower temperatures. In the Callendar method a Wheatstone bridge of some sort is necessary, and for workshop use a convenient form is said to be the Whipple self-contained indicator of the Cambridge Instrument Co., Ltd. The scale is drawn so that a change in resistance of 1 ohm in the thermometer circuit shifts the balance-point on the slide wire from 0 deg. C. to 100 deg. C., and thermometers of 1 ohm F.I. are used. The variations in the constant for reasonably pure wire would not be likely to cause a greater error than 2 deg. C. at 1,000 deg. C. or 0.5 deg. C. at 500 deg. C. An ice reading should always be taken before and after using the thermometer for precision work, but there is no necessity for the frequent determinations of the other fixed points. It is necessary in industrial practice to use heavy sheaths, such as a porcelain tube enclosed in an outer iron tube, for the protection of the bulb. An accuracy of ± 1 deg. C. at 100 deg. C. can be attained, it is claimed, on this type of instrument if the indicator has been standardised.

The two-lead "distance thermometer" is usually made direct reading by using the out-of-balance current in the Wheatstone network to give an indication of the resistance, the three arms of the bridge not containing the thermometer remaining fixed. This method involves the adjustment of the battery current to a predetermined value. This type of instrument is not used for such high accuracy as the four-lead types, and is generally confined to fairly low temperatures—up to about 200 deg. C.

In dealing with thermocouple instruments the method of balancing out the additional junctions introduced by the measuring instrument are explained and illustrated.

A comparison is drawn between thermocouple instruments employing a rare metal, usually platinum-rhodium, and those using a base metal. The e.m.f. of the rare metal couple is of the order of 0.01 mV per deg. C., while that of the base metal couples is about five times as great. The advantage of the higher e.m.f. is more than counterbalanced by the fact that the alloys used cannot be made as homogeneous as the platinum alloy. The high e.m.f. of base-metal couples makes possible the employment of relatively robust measuring instruments, and the cheapness of the wires enables heavy-gauge couples to be used. "Hoskins" alloys, marketed in this country by the Foster Instrument Co. and known as chromel and alumel, stand up well against oxidation. The accuracy attainable in the best circumstances likely to be met in works practice with base-metal couples cannot be reckoned better than ± 10 deg. C. at 800-1000 deg. C., and it is not advisable to use base-metal couples for long periods at these high temperatures, though the Hoskins alloys can be calibrated up to 1,300 deg. C. With rare-metal couples, however, ± 3 deg. C. can be obtained with a little care, and temperatures up to nearly 1,600 deg. C. can be measured if it is possible to protect the couple adequately from reducing gases, while 1,400 deg. C. can be regarded as well within the reach of ordinary technical practice. Rare-metal couples are usually made of wire either 0.5 mm. or 0.6 mm. in diameter.

The author describes and compares the potentiometer and galvanometer methods of e.m.f. measurement. The former has the drawback from the industrial point of view of requiring the instrument to be set for each reading, an operation it is desirable to avoid if the observations are to be made by comparatively unskilled workmen.

A brief outline is given of the procedure for obtaining the fixed points where the calibrations are carried out in the works. The freezing points are conveniently observed by melting the metals in tall pots, keeping the surface covered with a layer of powdered graphite. The thermocouple should be protected by a small porcelain or silica sheath.

If the potentiometer is available, the e.m.f.'s at a series of these fixed points may be determined, and the e.m.f.-temperature curve then drawn.

The insulation of the thermo-couples and various constructional details are considered in detail, and in conclusion the author deals with the difficulties of obtaining the thermo-junction at the same temperature as that of the material concerned with. The most difficult problems are in the measurement of a gas flowing in a flue which is at a different temperature. Haslam and Chappell suggest drawing the gas at high speed past the couple inside a radiation shield, in order to put up the rate of heat transfer by conduction.

In an interesting discussion which followed the reading of the paper, it was pointed out that the chemical engineer wanted an instrument which would give an accuracy of ½ deg. at 1,000 deg. C. after the thermo-couple had had to be retrieved from the furnace by its cable. Another necessity called for was constant calibration of thermo-couple instruments in use, because the magnet could never be relied upon to be permanent. It was claimed that although the platinum-rhodium couple might give a greater accuracy than the base metal device, it was certain there would be a larger bill for repairs; for general works use a more robust instrument was desirable, even if the accuracy was out by 20 deg. in 1,000 deg. Where rare-metal couples were used, very great care must be taken to protect them from contamination. It had been found to pay to use rare-metal contacts for the switches.

One speaker emphasised the necessity of getting rid of the prejudice against the use of pyrometric instruments in those works where it had been the practice to rely on rule-of-thumb methods.

From the commercial point of view it was pointed out that one of the first essentials of the instruments was high internal resistance, which was very difficult to get at a low price if the instrument was also to be robust and stand up to workshop conditions. Advice was given to keep away from resistance thermometers because of the frailty of the bulb and the difficulty of obtaining constant voltage from the accumulators. For temperatures from 200 to 2,000 deg. F. it was possible to purchase a base-metal thermo-couple at a comparatively low price, and most manufacturers to-day could guarantee an accuracy of plus or minus 1 deg. The costs of the base-metal and rare-metal couples was in the ratio of 10 to 1 in favour of the former, and, apart from the heavy industries, it was not likely that temperatures above 2,000 deg. F. would have to be measured.

It was further claimed that there were industries in which an accuracy within 50 deg. was good enough, for which base-metal couples were suitable. A nickel-nichrome couple had been used for many years, both for scientific and rough work; it was most excellent and not expensive. The coil in the instrument of the Hoskins Thermo Couple Co. was referred to as of a peculiar metal which apparently it was impossible to solder.

The view was taken that it spoke well for this country that we were in the position we were to-day in regard to such instruments, because America at one time had got a long way ahead of us in the manufacture of instruments for recording temperatures accurately.

Canadian Radio Production in 1926.

The production of all radio apparatus and accessories in Canada during 1926 was valued at $6,277,544, f.o.b. factory, in addition to which furniture manufacturers sold wireless cabinets to the value of $708,658. The details of the production were:—

	1926. $	1925. $
Batteries	2,276,747	2,238,169
Condensers	13,281	41,626
Panels, dials and switches ...	29,895	88,103
Microphones, loud-speakers	146,074	412,556
Transformers	26,855	36,816
Valves	1,261,803	1,299,684
Complete sets	2,253,098	2,667,999
Miscellaneous	269,791	325,675
Total	$6,277,544	$7,110,628

Wireless receiving licences issued during 1926 numbered 207,328, compared with 134,486 in 1925, and broadcasting licences issued rose from 55 to 96. Imports of wireless apparatus from the United States amounted in value to $2,872,991.—*Reuter's Trade Service* (Ottawa).

A New Direct-Current Meter.

An improved type of d.c. motor meter which has recently been introduced has an improved characteristic and several new features of design.

A D.C. mercury motor meter which has recently been developed by MESSRS. FOX & OFFORD, LTD., represents a considerable deviation from the usual design of this class of apparatus, with, it is claimed, corresponding improvement in both its operation and facilities for maintenance.

The Lawson meter, fig. 1, is really the outcome of a number of patents which have been taken out from time to time by Mr. W. Lawson, meter superintendent of the Birmingham Corporation Electricity Supply Department. Fig. 2 shows the meter with the cover removed.

Perhaps the outstanding feature of the apparatus is its greatly improved characteristic curve. Fig. 4 shows an average curve obtained from tests on a dozen of the meters; it will be seen that the overload "droop" is negligible. This improvement is brought about by means of special dampers in the mercury bath, which take the place of the usual compensating coil. There are one fixed and one movable damping vanes. They are placed under the rotor, the "covered" area of which varies according to the disposition of the movable element, which affords a convenient means of regulating the speed of the rotor. An external lever, fig. 3 right, is provided for the necessary adjustment. The fixed portion of the damper covers the bottom slipper, but is insulated from it by means of very fine paper. The damper is secured to the moulding by means of three feet which are embedded in the compound.

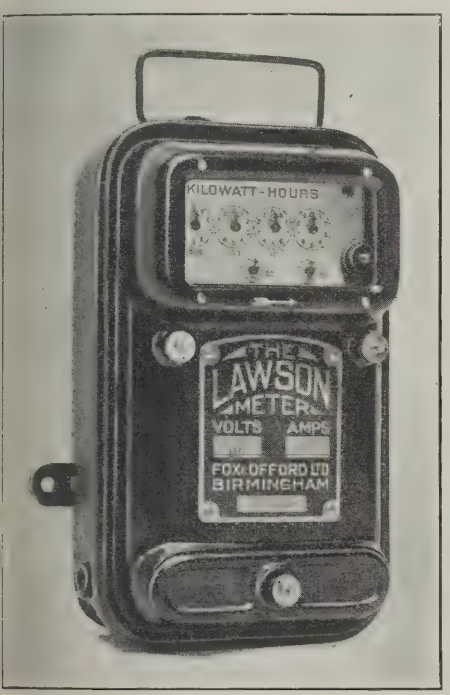

Fig. 1.—Lawson Meter.

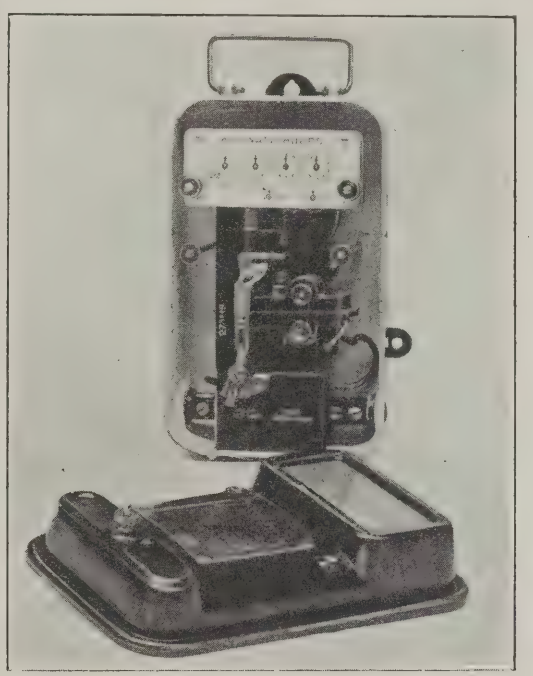

Fig. 2.—Meter Interior.

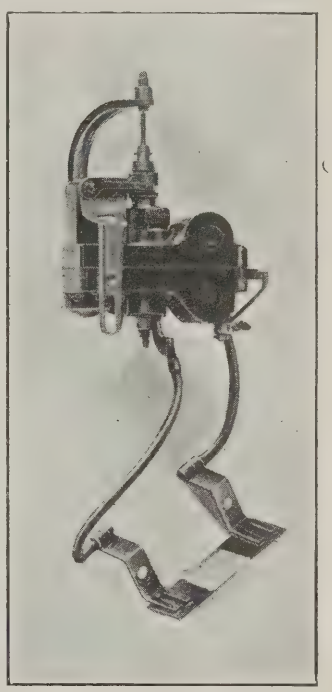

Fig. 3.—Mercury-Bath Unit.

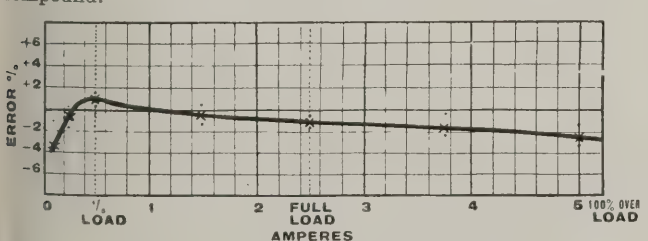

Fig. 4.—"Average" Characteristic Curve.

The mercury bath itself is claimed to be unique. It is made of a bakelite composition, moulded in two parts, and is easily removable as a complete unit, fig. 3, so that repairs can be carried out in the test room. The actual working clearance inside the bath is from 37 to 40 "thousandths." The bath unit is secured to the permanent magnet by means of two thumb screws which, in addition to the terminal screws, are the only ones it is necessary to manipulate in order to remove the unit. For given sizes of meters the bath units are interchangeable.

To render the bath removable entailed a great deal of research which resulted in the provision of special soft-steel slippers moulded into the bakelite. When the unit is put in position the slippers slide between the poles of the magnet and become convenient pole pieces. The design of the bath was only rendered possible by the ability to mould the slippers into the bakelite. It is claimed that the bath is the only moulded one on the market.

As shown in fig. 3, the unit carries both the jewel and the driving pinion, a bracket attached to the moulding carrying the upper or guiding bearing. In connection with the spindle a special sealing device is employed. The upper part of the spindle carries a cone collar which acts as the necessary coupling for the pinion. A special ebonite bush in the top section of the moulding surrounds the spindle. By means of an external lever the bush is raised so that a suitable leather washer in the top is brought into contact with the cone, so locking the spindle and sealing the chamber against leakage of the mercury. The cone is of nickel silver and gives the correct balance to the rotor so that it floats in the mercury. A bakelite filling screw is provided in the top of the bath unit.

As indicated in fig. 3, the larger meters have their shunts soldered directly across the bath leads, so that there is no fear of the shunts getting mixed when interchanging the units. By means of a special tool the shunts are "pinched" for the purpose of calibration.

An unusual and interesting method has been adopted for securing the counter. Two pillar screws project from the interior and are provided with a screwed sleeve and a collar on each. The counter is "dropped" over these sleeves, which can be turned by a large D thumb washer located on the front ends. The adjustment of the position of the counter can therefore be determined with great accuracy and ease. Suitable lock-nuts are, of course, provided.

The permanent magnet lifts out from the case by means of three screws. The whole of the interior of the meter is carried on external bars at the back of the apparatus, and it is on these bars that the meter is hung. The terminals are moulded into ebonite blocks and side-entrance leading-in is provided.

The case is of light sheet-steel and for any size up to 20 A the meter weighs 7½ lb. By means of suitable feet the meter is arranged to stand upright on the bench—a useful feature in the test room. The meter can at present be made for pressures up to 500 V and loadings up to 150 A.

It is interesting to note that about 5,000 of the meters have been supplied to the Birmingham Corporation, and that some have been on circuit for about 18 months and given very satisfactory results.

Marking Vacuum Cleaners for Denmark.

By a recent Government decision, as from July 1st, all foreign vacuum cleaners imported into Denmark must be marked with their place of origin.

Electricity Supply in the West Midlands.*

By S. T. ALLEN, Chief Engineer and Manager, West-Midlands Joint Electricity Authority.

ONE of the fundamental faults of early legislation was its encouragement of small isolated electricity supply areas, with an almost entire absence of encouragement of co-ordination as between supply authorities and failure to appreciate the necessity of standardisation.

The great war opened our eyes to the position we were drifting into; it showed how essential electric power was to our manufacturing and industrial life, and the importance of the conservation of coal.

In the Midlands, in 1916, a committee of chief electrical engineers was formed to deal with an area embracing the counties of Warwick, Worcester, Stafford, and Salop, and part of Hereford; the area was divided into eastern and western sections, roughly corresponding with the frequencies of supply (25 and 50 periods) prevailing in those portions, and a separate committee was formed for each section. Thus arose the committee of electrical engineers in the district which was then styled the "North-West Midlands District," which was responsible for initiating the work which culminated in the formation of the first Joint Electricity Authority to commence practical operation by itself on the lines of the Electricity (Supply) Act of 1919. This Committee in March, 1918, recommended to a conference representing the various authorised electricity supply undertakers in Staffordshire and Shropshire the setting up of a Joint Electricity Board for the district. A technical committee appointed by the Conference, of which the author was chairman, drew up a report on the subject, which became the basis of the scheme that is now being operated, with little alteration; the report embodies conclusions similar to those of the Coal Conservation Committee and the Williamson Committee appointed by the Government which led to the establishment of the Electricity Commission. The Committee approved the report, and after the passing of the Act of 1919 a scheme was prepared and submitted to the Electricity Commissioners.

An inquiry was held by the Commissioners in February, 1922, as the result of which a new conference was formed representative of electricity supply undertakers south of Stafford, in Staffordshire and Shropshire; a new scheme was prepared, and after a further inquiry in October, 1924, was approved by the Electricity Commissioners, who issued a draft Order in November constituting the amended area an electricity district by the name of the West Midlands Electricity District. A final inquiry was held in December, 1924, and an Order made which was confirmed by Parliament in December, 1925, after nearly 10 years' work on the subject, involving an immense amount of discussion and negotiation.

The area controlled by the Joint Electricity Authority for the West-Midlands Electricity District covers over 1,000 square miles, a very large part of which has no public supply of electricity. The Authority consists of 23 members representative of all the interests concerned. Its first duty was to complete the transfer of the generating stations of the existing authorised undertakers to the Authority on approved terms; the transfer will take place after due notice has been given and when the Authority's technical scheme, interlinking mains, &c., are ready. The whole of the generating stations, land, buildings, and machinery (with the exception of West Bromwich, where the land and buildings will be leased and the machinery purchased) will be transferred to the Authority; the existing owners will retain their main switchboards, which will be used in the future purely as feeder switchboards for the distribution of bulk supplies. The price agreed upon for the transfer is uniform, and is based upon the original cost, less depreciation. The whole of the generation will be carried out under one control, and the electricity required by the existing owners of generating stations will be sold to them at cost. The scheme is a co-operative movement to provide electricity at the lowest possible price—lower than if the existing generating stations continued independent operation—to the whole area.

Given control by one competent large body, it was obvious that single large base-load generating stations with large units of plant and low costs of production could be erected to provide for all future requirements, and the trunk mains interconnecting them with the existing stations would supply also the new districts. Distribution will be carried out by the existing authorised undertakers, except in the areas not hitherto covered, where the Joint Authority will probably be the distributor. Supply will, as far as practicable, be standardised as regards current, frequency and pressure. The standard transmission pressure will be 33,000 V for the primary mains and 11,000 or 6,600 V for the secondary mains.

The following generating stations will be utilised and possibly extended, namely:—Birchills (Walsall), Ocker Hill (Tipton), Black Lake (West Bromwich), and Commercial Road (Wolverhampton); other stations will be utilised for the time being. Immediate provision will have to be made for the erection of a new capital station at Ironbridge, and subsequently a further capital station. Interconnecting lines will also be required during the first stage of development between the above-named stations, as well as bulk supply lines to Shrewsbury and Wellington.

Since the Authority came into being last year it has formed a committee to deal with the technical and engineering aspects of the work, and another to deal with the financial and legal aspects. A building was purchased in Wolverhampton, the centre of the District, which is being adapted for central administrative offices at an estimated cost of £11,000. The Technical Committee commenced work at once, and the author's estimates, covering expenditure of 3½ million pounds, have already been started. Work on the 33,000-V interlinking transmission mains is being pressed on with all speed, and the Birchills and Ocker Hill generating stations are being extended at an estimated cost of £366,000. Orders have been placed for 18 large step-down transformers for the linking-up scheme, and an order for 33,000-V, 500,000-kVA capacity and other switchgear costing about £125,000 has just been placed—one of the largest single orders for switchgear ever placed in and for this country. On account of the high value of the short-circuit currents which have to be allowed for, this switchgear is of a special heavy type, individual units weighing as much as 8½ tons and requiring over 10 h.p. to complete the closing operation. New generator switchgear is being erected at each of the existing generating stations in place of the present generator switchboards, which will be retained by the present owners.

The site of the Ironbridge station is at Buildwas Junction on the River Severn; the station will be designed for a capacity of 160,000 kW, and will be built in sections forming complete connected generating stations. The keynote will be simplicity with commercial efficiency, and the author hopes that by the time the plant is ordered sufficient experience will have been gained to warrant drastic changes in the methods of steam raising and fuel preparation. He hopes that investigations and satisfactory experiments will have so far advanced as to warrant the inclusion of low-temperature carbonisation plant at the Ironbridge station, and provision will be made for the adoption of such plant even if it is not put down in the first instance. He expects that, apart from the necessity of such plant from a national point of view, its use in connection with large power plant will eventually be found to bring about a higher commercial efficiency.

Turning to the Act of 1926 and its relation to Joint Electricity Authorities, the author points out that the Central Electricity Board will not (save under exceptional circumstances) own the generating stations like the West-Midlands Joint Electricity Authority. It may choose one or more of the stations of that Authority to be "selected stations," but cannot give supplies to authorised undertakers in the District without the consent of the West-Midlands Authority. The West-Midlands electricity scheme is not a Government scheme put into operation as a result of the new Act.

If it is shown that there is a demand for electricity supply in any part of the District not already covered, with a reasonable prospect of its being remunerative, the Authority is under obligation to submit proposals for the supply of that area to the Electricity Commissioners; the scheme may include the provision of a main sub-station, main cables, and other sub-stations and distribution mains and services, together with the supply of installations and apparatus to consumers, the provision of local showrooms, &c.

The days have gone by when electricity was considered a luxury for the rich; it is now a necessity for all classes. A supply is being given in thousands of the smallest class of houses in the West-Midlands District, and it is hoped that, having regard to the facilities that will be offered to would-be consumers, there will be such a universal demand for electricity that the prices which it will be possible to charge will benefit the whole district, that existing industries will be greatly improved, and new industries established. A spirit of co-operation and enthusiasm is necessary; petty dissensions must not be allowed to mar the issue. The author hopes that those interested in the gas industry in the area will not make the mistake of opposing electricity supply development, as it will be against their own interests to do so. Experience shows that the gas supplies have steadily increased with the increase of electricity supply. The Authority is considering the possibility of incorporating a low-temperature carbonisation plant in the Ironbridge generating station scheme, which will allow of the production of large quantities of oil, motor spirit, and rich gas, so that it may yet offer the gas concern cheaper supplies of gas and co-operate with it as far as that is concerned.

* Abstract of an informal address delivered to the Chamber of Trade, Wellington, May 24th, 1927.

Electro-Magnetic Couplings.

Some Applications of the Forster Clutch and Generator Drives.

An interesting feature of many of the new hydro-electric stations in the course of construction in Italy is the use of electro-magnetic clutches for coupling up the turbines and the generators. The design which is being generally adopted is that which has been developed by a Swiss engineer, Herr Paul Forster, two of whose clutches—one designed to transmit 6,000 h.p. at 100 r.p.m. and one for 5,000 h.p. at 85 r.p.m.—have been employed on steel-rolling drives for some time past. It was the success which attended the Forster clutch under the extremely onerous conditions obtaining in rolling-mill driving that led the engineers of the new hydro-electric station at Farneta, near Parma, Italy, to decide to adopt the principle in connection with the driving of their electric generators. Fig. 1 shows a sectional view of the clutch and illustrates its working. A feature of the design is the use of stationary exciting coils, which obviates the necessity for slip-rings and brushes as in the case of electro-magnetic clutches with rotating coils. Some idea of the size of the stationary-coil frame is indicated by fig. 3. A Forster clutch to transmit 17,000 h.p. is stated to weigh under 8 tons and to require for its operation an excitation loading of 2.5 kW, d.c. Non-magnetic iron is used for the double cone and the frictional surfaces are all metallic.

When completed, the plant at the Farneta station will comprise four sets, each of 12,000-kVA capacity, designed to run at respective speeds of 420, 500, 504 and 600 r.p.m. The clutch-operating switch will be mounted close to the turbine starting and stopping mechanism, so that at any time when the load on the station falls off, any one of the turbines can, after de-clutching, be brought to a standstill. The clutches are being designed with a high factor of safety, and will be capable of transmitting a maximum of 17,000 h.p. at 500 r.p.m. When

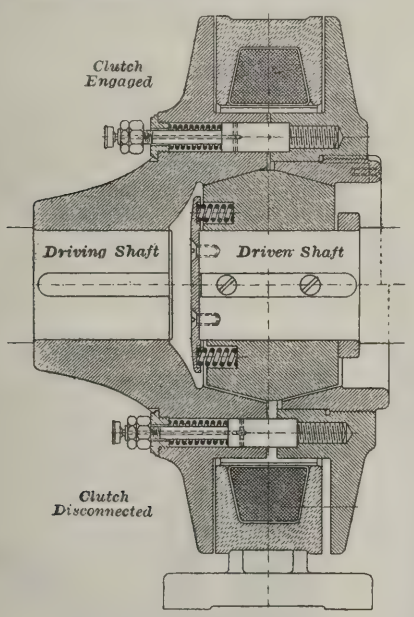

Fig. 1.—Forster Clutch ; Section.

disconnected from their respective turbines the generators will remain connected to the electrical circuit, and will be run as synchronous motors; by suitable adjustment of the field-regulating resistances they will be fed with the wattless current and so utilised as phase adjusters. When it becomes necessary again to use the machines as generators, the turbines will first be started and speeded up to a little more than the normal speed and the clutch then engaged, when, after the necessary adjustment of the turbine inlet valve, and the field regulators, each set will once more resume its normal function of power generation.

Another interesting feature of the new station is that although the four generators are of equal capacity, two are of the ten-pole type, while the others each have twelve poles. This is to allow the station to feed two different distributing systems at different frequencies. The peak loads for the systems occur at different times of the year and by means of a Forster clutch between each pair of alternators, each one can be connected up, with the other one, to the faster or slower turbine, as the case may be, thereby providing additional plant capacity on one of the 42- or 50-cycle systems, as required, without additional plant in the station. The change-over from generator or phase corrector to frequency converter can be effected without operating the main switch.

A similar application of the Forster electro-magnetic clutch can be seen at the recently completed Predaro power station of the Società Ozola of Milan. From the diagram, fig. 2, for which we are indebted to the *Schweizerische Bauzeitung*, it will be seen that the shafts of the two turbines and the generators are all in line with clutches suitably arranged between them, the normal speed being 500 r.p.m. One of the generators is an asynchronous machine and the other synchronous. The former is so constructed that it can be run either as a

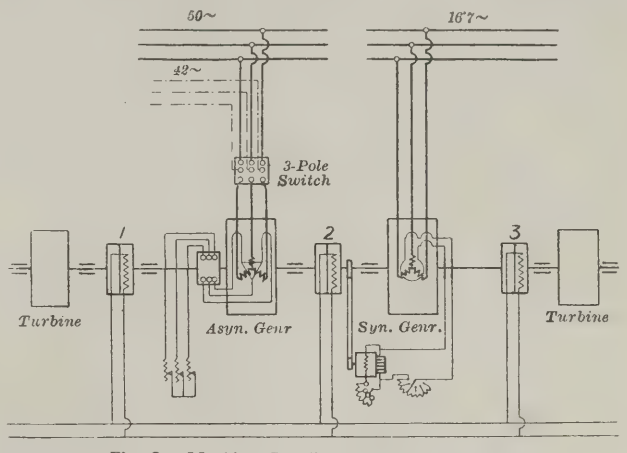

Fig. 2.—Machine Coupling at Predaro Station.

generator or a motor. In addition it has two separate windings—one for ten and one for twelve poles—and at practically a constant speed of from 500 to 504 r.p.m. can be run on or generate either 42- or 50-cycle current. As a motor the machine develops up to 10,000 h.p. and is started by a liquid resistance, by means of which it is also possible to effect a slight adjustment of the speed. The synchronous machine, which has a capacity of 8,500-kVA at 500 r.p.m., is used to generate 16.7-period a.c. for electric-railway operation.

By means of the three clutches, the following combinations of the two turbo-generator sets are possible :—

1. With clutches 1 and 3 engaged and No. 2 disconnected, both sets are generators, one producing either 42- or 50-period current, and the other supplying at 16.7 periods.
2. With clutches Nos. 1 and 3 disconnected and No. 2 engaged, the generators work as frequency converters, feeding from either system and supplying the other.
3. With clutches 1 and 2 engaged and 3 disengaged, both the generators can be driven by the left-hand turbine.
4. The synchronous generating set can be cut out of the railway-supply circuit,when, after disengaging the clutch and stopping the turbine, the generator can be run as a phase corrector.

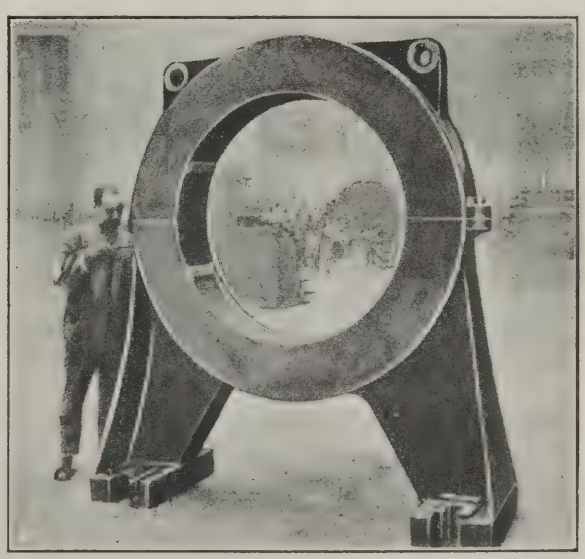

Fig. 3.—Stationary-Coil Frame.

The Forster clutch is also adaptable for use in connection with high-speed steam as well as hydraulically operated plant. An example of this kind is to be seen at the municipal station in Turin, where a steam turbo-generator set which develops 14,500 kVA at 3,000 r.p.m., is coupled up by an easily-dismantled mechanical clutch. When the load on the station is low, the generator is connected by a Forster clutch to an asynchronous motor and used as a phase corrector.

New Electrical Devices, Fittings and Plant.

Readers are invited to submit particulars of new or improved devices and apparatus for publication in this Section.

Non-Pitting Control Apparatus.

A recent development of the DUNDEE ELECTRICAL REPAIRS CO., LTD., Guildhall Works, Erskine Street, Dundee, is a range of starting and control pillars for d.c. motors in which is embodied a patented method of eliminating the burning and pitting of the contacts and brushes usually associated with the short-circuiting type of apparatus. The result is achieved by the introduction of a second short-circuiting brush, which is carried by a common brush arm, but insulated from the main brush. By means of a contactor the auxiliary or leading brush is rendered dead when in the act of making contact with one of the studs, and does not carry the load until full-contact area is established. A second set of contacts is employed to provide the necessary timing for the contactor. Fig. 1 diagrammatically represents the arrangement. The switch arm 4 moves in the usual way over a number of main contacts, cutting out the resistances 10-13. The arm carries both the main and leading brushes, vertical, which are in permanent contact with the fixed horizontal contacts. The contactor 20 is arranged to open and close at predetermined periods by means of the upper timing contacts, which are fed from the main brush circuit. The contacts are so spaced that connection is not made with any of the timing contacts until the leading brush is in full connection with the next stud. The operation of the contactor then puts the two brushes in parallel until full contact is made by the main brush. Fig. 2 shows a starting pillar with the panel slid forward, displaying the apparatus described.

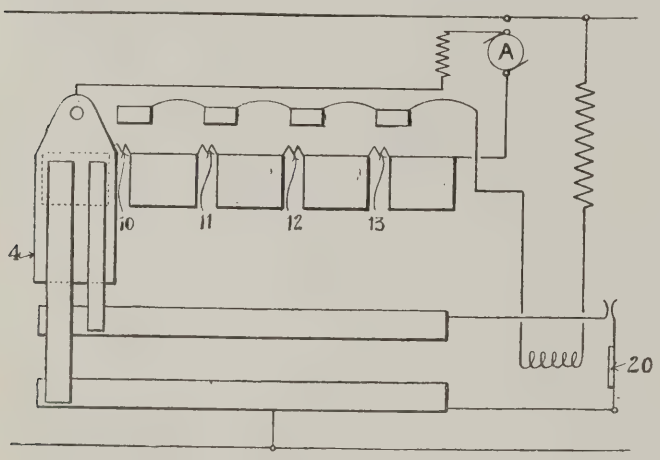

Fig. 1.—Non-Pitting Starter Connections.

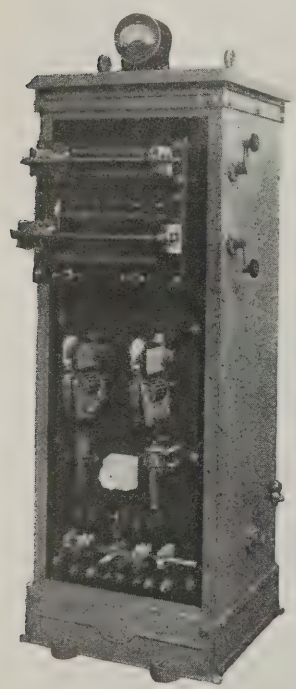

Fig. 2.—Starting Pillar.

Fig. 3.—Type C.T.T.E. Cable.

Fig. 4.—Type C.T.T.D. Cable.

C.T.S. Trailing Cables.

The advantages offered by c.t.s. cable have led to its use under conditions probably more severe than was originally anticipated. In many cases the cable is called on to stand up to severe mechanical compression, due to such occurrences as roof falls, and so on. With a view to providing additional protection to such rough treatment, MESSRS. W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., Holborn Viaduct, London, E.C.1, have designed some special types of c.t.s. cable. In all, five types of multi-core c.t.s. cable are provided. Class C.T.T.A. is the ordinary 3-core type with one insulated earth core. Class C.T.T.B. is similar, but the cores are covered separately with c.t.s., in addition to the usual external sheathing, thereby offering increased resistance to compression of the dielectric between the conductors.

An insulated earthing core is a feature of the next two classes, C.T.T.C. and C.T.T.D. In addition, each core is covered with a supplementary earthing conductor, consisting of a tinned copper braid, which is in contact throughout the whole cable length with the main earthing conductor. The first of the last two mentioned classes is insulated and sheathed similarly to class C.T.T.A., while the latter, fig. 4, has its cores reinforced separately with c.t.s. sheathing, in addition to the external sheathing.

For use in connection with certain protective systems, such as the Williams-Rowley, a further class, C.T.T.E., has been devised. This cable, fig. 3, has an earthing and a pilot core. In addition, a supplementary earthing braid is embedded in the external sheathing. The cores are also reinforced with c.t.s.

A New Theatre Switch.

The accompanying illustration, fig. 5, is of a new s.p. switch which has been designed by the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2, specially for service in theatres and places of that description. The principal features are indicated. The pedestal which supports the handle lever is separate from the contact blocks, and when the circuit is broken is entirely insulated from the current-carrying parts, which are of low current density. Both contacts have a simultaneous quick-break action. Provision is made for front connections so that the terminals are easily renewable.

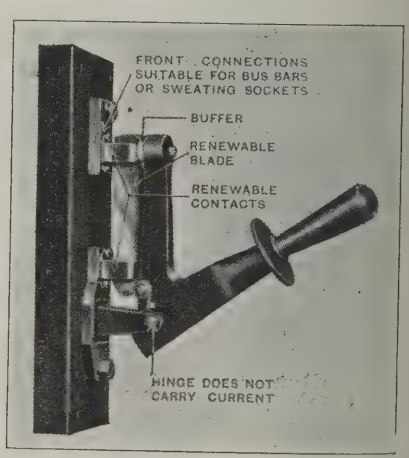

Fig. 5.—Theatre Switch.

A V-Chain Drive.

What is described as Cork's spring-clip transmission chain V belt is a development of MESSRS. CORK'S SPRING CLIP CHAIN BELT CO., Upton Road, Bexleyheath, Kent. It consists of a standard cycle chain, over which spring clips are sprung and secured to the projecting ends of the link pins. Compressed fibre pads are inserted in the sides of the clips, and are tapered at 28 deg. so as to afford a convenient V drive. The result, it is claimed, is a hard compressed belt, free from stretching or slipping. Owing to the increased strength of the chain a smaller "belt" can be used. A clip wrench is employed to remove the clips from the chain, in order to avoid undue side pressure of the pads.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

Re-assembly.

Parliament re-assembled on Monday, June 13th.

"Beam" Communication with South Africa.

On June 14th, Sir W. MITCHELL-THOMSON informed Mr. DAY that the official seven-day test of the beam wireless stations for the Anglo-South African service had not yet begun, but the contractors expected to be able to hand the stations over for the test at an early date.

World Copper Syndicate.

On June 14th, Sir E. CECIL asked the President of the Board of Trade whether his attention had been drawn to the fact that, consequent upon the activities of an international copper syndicate, British manufacturers of finished copper products had been placed at a considerable disadvantage, in the absence of a free market, in purchasing the supplies necessary for their trade requirements; and whether he would consider taking steps to encourage by any practicable means producers of copper in the British Empire, so that this country should not be at the mercy of foreign syndicates for its supplies of copper in the event of any national emergency.

Sir P. CUNLIFFE-LISTER said he was aware that a large proportion of the producers of copper in the United States had formed a company to regulate the sale of raw copper outside that country, and that important European interests were also parties to the arrangement. He was further informed that since the formation of the company the prices quoted to British consumers had frequently been higher than the equivalents of the prices quoted to American consumers. It was clearly of great importance that British users of copper should be able to obtain supplies on terms as favourable as those given to their competitors, and he would welcome the development of copper production and refining within the Empire.

The London Joint Authority Bill.

The House of Commons Committee (presided over by Sir Arthur Shirley Benn) upon the Bill promoted by the London and Home Counties Joint Electricity Authority (the main purpose of which is to obtain power to acquire a site for a large generating station at Duke's Meadows, Chiswick, on the Thames), concluded its consideration of the Bill last week. Among the witnesses called was Mr. J. S. Highfield, past-president of the I.E.E. In the course of his evidence Mr. HIGHFIELD referred to the proposal of the London Power Co., which is now before the Electricity Commissioners, for the erection of another large station at Battersea, and expressed the view that if that station were sanctioned there would be no need for a station at Chiswick. The CHAIRMAN pointed out that the Electricity Commissioners had intimated that there ought to be two stations.

Mr. F. J. WROTTESLEY, K.C. (for the Barnes U.D.C., which was opposing), suggested that the Committee should adjourn until it had learned what decision the Electricity Commissioners had reached with regard to the proposed station at Battersea. The CHAIRMAN said that the Committee wished to proceed with the Bill.

The Committee, at the conclusion of the evidence, found that the preamble of the Bill was proved, subject to the Electricity Commissioners determining that the new station at Chiswick should be a "selected station" under the Central Electricity Board, and subject to the Board's adopting the scheme.

Mr. H. P. MACMILLAN, K.C. (for the London Power Co.), said that the company had to appear before the Commissioners on June 21st, to seek sanction for the erection of the Battersea station. There were many opponents, and he did not want to be prejudiced by any decision of the Committee in this case. He asked for the insertion of a clause in the Bill which would have that effect. The attitude of the Joint Electricity Authority was that the station at Battersea would not be competitive with Chiswick, and, indeed, that both stations were necessary. All he asked was that the *status quo* should be preserved.

The CHAIRMAN said that the Committee had not considered the Battersea station in any way, and did not see why it should attempt to deal with it. They had left the Commissioners to say what stations they wanted, and where they should be erected, having regard to all the circumstances.

The Department of Overseas Trade.

Replying on June 20th to a question by Mr. Hore Belisha, Mr. BALDWIN said that the matter of the abolition or retention of the Department of Overseas Trade was engaging the close attention of the Government, but he was not yet in a position to make a statement on the subject.

County of London Electric Supply Co. Bill.

The County Councils of Surrey and Hertfordshire have announced their intention of opposing this Bill in the House of Lords.

Correspondence.

Correspondents should forward their communications **as early as possible.** *No letter can be published unless we have the writer's name and address in our possession.*

E.h.p. Transmission with 33,000-Volt Cable.

The article by Mr. G. W. Preston in your issue of June 10th is interesting; such articles are very useful in drawing attention to the present delicate nature of 33,000-volt cables. These cables must apparently be handled with such care that only the manufacturers should be allowed to touch them; if they must be run in iron pipes their current rating must be reduced; if they climb a hill, reservoirs of oil to prime them may be necessary, and possibly diaphragm boxes will be required in addition. Where the cables are exposed to the air they must have sunshades. In general it would therefore appear that they require very careful nursing from the time of their manufacture to their being put into service, and results obtained would tend to show that they require this nursing to be continued during their period of service. The types of breakdowns that have occurred on such cables are numerous, and faults have occurred under all conditions of loading. To users of cables and those supplied by them, the nature of the fault and the reason of the breakdown are entirely immaterial, and the frequent breakdowns only show that the cable is not good enough, and is not able to meet the conditions under which it operates.

Possibly they are too cheap (or too inexpensive); certainly their working factor of safety after one or two years is too low. It costs very little more to lay a 33,000-volt than an 11,000-volt cable, yet for the same section, three times the load may be carried more efficiently. On the other hand, a view has been expressed in these columns that a 33,000-volt overhead line is more reliable than the present-day 33,000-volt cables. If this is so, one can only say that these cables are dear at any price.

It is too soon to speak of the performance of the "H" and "S.L." types in this country; an improvement in performance is confidently expected, but the question is, will these cables be as reliable as the old original 6,600-volt cables which have been worked for many years at 11,000 volts?

A. T. Scott.

London, *June 14th*, 1927.

Cheaper Wiring.

I have read the article by "H.W.C." with interest and some misgiving. "H.W.C." is perfectly right in his remarks relative to the home-made laws of certain supply company officials, who in many cases insist on having things done to suit their particular whims and fancies. All contractors will have come up against this kind of thing, and if they have sufficient knowledge of the Acts of Parliament relating to the supply of electricity they will be in a position to put the "know-alls" in their proper place. I, however, will not advocate cheaper wiring, as this cheapness is at present to the detriment of the contracting industry. I certainly would never dream of fitting four or five heating sockets, looping them together with 3/.036 or 7/.029 cable, and connecting them to one circuit. This arrangement may be all right for an electrical engineer's own house, as this gentleman would know the carrying capacity of his cable and how to use his apparatus. For anyone else, however, the job would (in my opinion) be indeed a shoddy one. Far too much cheap wiring is being done and seems even to be encouraged by some supply authorities, who should deprecate such work. It is not our policy as respectable contractors to encourage cheaper wiring; rather let us say better wiring, and uphold the status of the contracting industry. If anyone can suggest a method of attaining this object I shall be pleased to give any help that lies in my power. I will anticipate anyone suggesting the E.C.A. as a possible solution and would state that in this area (in my opinion) this body is more a hindrance than a help to really good contractors.

A. Milne.

Glasgow, *June 16th*, 1927.

Metal-clad Draw-out Switchgear.

Mr. Davies, in his letter on the above subject in your last issue, infers that the advocates of vertical metal-clad switchgear have had no opportunity of witnessing circuit-breaker interrupting-capacity tests. I would like to inform him that they have not only witnessed tests on their own breakers with equivalent plant to that which he refers to, but have also seen kinematograph films showing the performance of various sizes of horizontal metal-clad units when the breakers are tested to destruction. These have in no way modified their view as to the superiority of the vertical principle, and have given the lie to the speculation that the busbars on horizontal gear are immune from trouble in the event of a breaker failure. The breaker referred to in his letter can scarcely be called "reasonably flameproof" when such a cloud of flame resulted, and either horizontal or vertical bars would have been enveloped in such a case. The performance, however, indicates the necessity for revision in that particular design. That circuit breakers can be con-

structed without such an emission is evidenced by the fact that the latest A.I.E.E. rules state: "The breaker shall perform at or within its own interrupting rating without emitting flame." It is a matter of design, location, and type of venting, and there is no reason why one type should not be as immune from trouble from this cause as another. It is significant that the largest switchgear manufacturers in the world, who were the first to have experience with a large plant for interrupting-capacity tests, have already supplied vertical drop-down gear for a power station designed for a half-million kW of plant.

Mr. Davies also criticises the double-breaker system of busbar selection as incorporated so simply in the vertical type of gear. I wish to point out that this system has not only stood the test of several years' operating duty on all pressures up to 33 kV, but has successfully withstood severe tests designed to prove its efficiency. A standard double breaker in one tank had its busbar terminals connected to two independent 33-kV supplies, and one breaker was put through rupturing-capacity tests whilst the other remained open. Before the tests the engineers, who had had long experience with the testing plant, predicted that there would be no danger of the trouble spreading from the breaker undergoing tests to the auxiliary busbar terminals. Their prediction was fully confirmed by the tests. Furthermore, the contacts of the breaker which had not been in service were not in any way damaged, and the second breaker was thoroughly fit for service.

It is not for one moment claimed that the double breaker in one tank is as good as two breakers each in separate tanks; this would, of course, be more costly, and take up more space. It is, however, contended that the arrangement provides a safe and convenient method of bus selection, enabling the facilities which duplicate bars afford to be taken advantage of, whilst at the same time providing a spare breaker which can be used in case there is not enough time to inspect the contacts after operation on a fault.

The "novel ideas" Mr. Davies refers to were introduced by my company to eliminate the weaknesses of the old designs and to provide the facilities which modern requirements demand. Happily these are now backed up not only by service experience, but also by special tests designed to prove their efficiency. In view of this controversy I have obtained permission to publish the enclosed letter from the Manchester Corporation Electricity Department which was received in 1925, and the letter may be of interest to your readers.

S. Ferguson.

Manchester, *June 18th*, 1927.

[Enclosure.]

Manchester Corporation Electricity Department,
Dickinson Street, Manchester,
November 6th, 1925.

Subject: 33 and 6.6-kV Switchgear—Dickinson Street Sub-Station.

Messrs. Ferguson, Pailin, Ltd.,
Higher Openshaw, Manchester.

Dear Sirs.—In reply to Mr. Ferguson's inquiry concerning our experience with the operation of the double switch unit type of switchgear installed at the Dickinson Street substation, I am pleased to say that, so far, it has proved highly satisfactory, and provides the degree of flexibility necessary at that station.

Both sets of busbars are in operation, and two separate ring main systems pass through the 33-kV bars, whilst on the 6.6-kV side one bus-bar is connected with the Barton supply, and the other to Bloom Street or Stuart Street, as the case may be.

Work has been carried out on one set of bars on the 33-kV system, with the other set in service, but, of course, every precaution was taken to prevent any mistake in operation during the time the work was in progress.

Yours faithfully,

H. C. Lamb,
Chief Engineer and Manager.

Legal.

Le Breton Engineering Co. v. Norton Wireless Co., Ltd.

In the Shoreditch County Court, on June 14th, before Judge Cluer, Mr. W. Le Breton, trading as the Le Breton Engineering Co., St. John's Wood, N.W., sued the Norton Wireless Co., Ltd., to recover £72 18s., the price of 7½ gross of variable gridleaks which the defendants were said to have ordered and refused to take.

For the plaintiff it was stated that the order was a verbal one given to an agent. It was for 15 gross, and half had been delivered and accepted. Mr. Kelly, for the defendants, admitted giving an order for 7½ gross, but said that he had never seen the agent which it had been alleged took the order for 15 gross.

Judge Cluer said that the alleged order should have been confirmed by the plaintiff. He accepted the defendants' version and gave judgment for them with costs.

Reviews.

The Atomic Theory. By Prof. Arthur Haas; translated by T. Verschoyle. Pp. xiv + 222; figs. 56. London: Constable & Co., Ltd. Price, 10s. 6d. net.

The author of this book is professor of physics in the University of Vienna, and the work here translated, which is practically identical with Part III (of Volume II) of his "Introduction to Theoretical Physics," grew up out of the lectures which he delivered at the University of Vienna in the exercise of his profession. Two years having elapsed since the appearance of the German book, it has been necessary for Professor Haas to make sundry corrections and to supply some further additions, in order that the English edition may be well up to date. The rate of progress in the advance of this branch of science is at present so great, that a book begins to become obsolete from the very date of its publication; and readers interested in the subject, and wishing to keep themselves well informed, have constantly to be buying new books if they are not to fall behind in their knowledge. It is therefore particularly needful, in noticing books on this subject, to indicate clearly the nature and scope of its contents, so that readers may not find themselves purchasers of too many books that they find to be of little service to them.

The object of the work before us is to explain fully the fundamental ideas involved in modern atomic theory and set out the most important consequences that ensue therefrom, so far as this can be done without introducing the higher mathematics, or presuming any deeper knowledge of the science of physics than is comprised in the ordinary school curriculum. The book is therefore designed to be of assistance to all persons of scientific education, and the author believes all workers in allied branches of science, such as chemistry, will find it adapted to their needs. Professor Haas has a clear mind himself and a gift for making things clear to his readers. It would be difficult to name a work of this size in which the material dealt with was better handled. The first chapter deals with the elementary quanta: here the facts on which the present theory was built up are concisely and admirably marshalled. In the next chapter the theory of the hydrogen atom is set out with the same lucidity. Chapter III is devoted to röntgen rays, and Chapter IV to the theory of the elements. On this foundation, the general theory of spectra and of atomic structure can then be firmly established, and this is done in the fifth and last chapter. The valuable contents of the book however do not end here, many useful pages follow by way of an appendix. First a summary of the contents of each chapter is very helpful in gaining a comprehensive view of the several departments of the subject. Then a synopsis of the symbols most frequently used. This feature might with advantage be imitated by all writers, as it saves one who consults the book hurriedly, much turning over of pages. The same might be said of the table of the universal constants in atomic physics which follows. Finally there is an historical summary valuable for rapid reference, which serves to impress—indeed, it almost stuns—the mind with a sense of the prodigious rate at which knowledge is now being accumulated. A well designed index concludes a work which, in 220 pages, ably covers the whole range of the subject. In spite of the necessity for so much compression the book is eminently readable, thanks to wise selection of material and the excellence of its arrangement.

Rotary Convertors: Their Principles, Construction and Operation. By E. P. Hill. Pp. xiii+329; figs. 247. London: Chapman & Hall, Ltd. Price, 25s. net.

Although the "British Standard Glossary of Terms used in Electrical Engineering" (B.E.S.A. Report No. 205) enjoins us to adopt the American name "Synchronous Convertor"—a point with which we do not quarrel—we still like to think that this type of machine, at least for 50-cycle frequency, was developed and perfected by British designers. It has always appeared to us that the 25-cycle compromise, with its costly consequences under the new Electricity Act, was one of the least desirable engineering developments ever imported into this country.

The future of the rotary convertor furnishes matter for interesting speculation. With the rather rapid conversion from direct to alternating current for distribution it would seem that the relative importance of this type of machine is likely to diminish.

A feature that has doubtless proved attractive to many writers—though perhaps unconsciously—is the remarkable ease of deducing many facts concerning the action of the rotary convertor by the aid of elementary mathematics, and also the simplicity of the results thus obtained.

Though written by a designer, the book before us is not intended for designers, but for engineers responsible for purchasing, operating, or testing rotary convertor machinery. This fact largely explains the character of the book, but to our mind does not justify the use of so many general arrangements and photographic reproductions throughout the text. The book is beautifully got up, and the illustrations as a whole are excellent; but we think that money and space could have been saved with advantage by the omission of numerous photographs and other material. Fortunately, the book has not

been spoiled in this way, for there is much solid material which will achieve the intended purpose.

Turning now to the contents of the book, the reader will appreciate information on many points associated with the working of rotary convertors, in addition to much of what might be classed as standard information. In considering armature heating, it is satisfactory to note that the maximum conductor heating is discussed. Though this does not enable the maximum temperature rise to be accurately predicted, owing to the flow of heat, it does provide a means of estimating the output obtainable under given conditions. Among the constructional features dealt with, the question of the brush angle is argued at length. In view of the fact that the rotary convertor is the chief culprit in the interference with communication circuits, we should have preferred a much more detailed treatment of this discussion. Also the effect of saturated iron in transformers employed in connection with reactance control of the voltage might well have been dealt with at greater length.

There is a useful chapter on transformers and auxiliary apparatus. An interesting section on the origin of the triple harmonic is included. In the general treatment of this subject much yet remains to be done. The starting of convertors then follows, and many important details in this connection are emphasised. Though the author is on the staff of Messrs. Metropolitan-Vickers Electrical Co., justice is done to the methods used by other firms.

The remaining chapters deal with operation, control, specifications, and testing, but we think enough has been said to show that the book will be of great service to those requiring a good general knowledge of rotary convertor practice. The book concludes with a four-page bibliography and an index.

Published Specifications.

Compiled expressly for this journal by a firm of Chartered Patent Agents. The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

Trade Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be lodged within one month from the dates given :—

June 8th.

Welradco. No. 479,021. Class 8. Instruments and apparatus for use in wireless telegraphy and telephony.—Wooldridge Radio Co., Ltd., 39, Lisle Street, W.1.

Brunet. No. 479,214. Class 8. Electric transformers, loud speakers, and headphones.—Pettigrew & Merriman (1925), Ltd., 2 & 4, Bucknall Street, W.C.2.

Aurion. No. 480,162. Class 11. Apparatus for the use of deaf persons.—Lawrence & Mayo, Ltd., 19, New Oxford Street, W.C.1.

Electrolux. No. 469,787. Class 50. Refrigerating chests, safes, and goods of a like kind.—Electrolux, Ltd., 153 & 155, Regent Street, W.1.

Glypanite. No. 479,395. Class 50. Electrical insulating material.—Micanite and Insulators Co., Ltd., Empire Works, Blackhorse Lane, Walthamstow, E.17.

Himegite. No. 480,463. Class 50. Insulating substances (electrical).—T. De la Rue & Co., Ltd., 110, Bunhill Row, E.C.1.

June 15th.

Touchtone. No. 472,904. Class 8. Wireless telephonic receivers, but not including accumulators or any goods of a like kind.—Gent & Co., Ltd., Faraday Works, St. Saviour's Road East, Leicester.

Liontron. No. 479,444. Class 8. Crystal detectors.—S. Lyons, 119, Clerkenwell Road, E.C.1.

Walbro, W.B. (lettering and design). No. 479,739. Class 8. Wireless telephonic apparatus and instruments.—Walker Bros., St. Joseph's Works, High Street, Bramley, Guildford.

Synchronola. No. 479,893. Class 8. Wireless telephonic apparatus and parts.—Synchronola Radio Co., Ltd., 150, Brownlow Road, Horwich, Lancs.

Davent. No. 480,759. Class 8. Electric batteries.—M. Wright (Midland Electrical Co.), 113, Coleshill Street, Birmingham.

Stella Electric Lamps (lettering and design). No. 479,034. Class 13. Electric lamps of ordinary metal made in Great Britain.—Stella Lamp Co., Ltd.

Mainten. No. 479,588. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching, but not including thermostats or any goods of a like kind.—H. R. Malby (Radio & Electrical Installations), 126, Portland Road, Hove.

Medicoil, No. 479,542, and Sunviray, No. 479,543. Class 11. Instruments, apparatus and contrivances for surgical or curative purposes.—Ajax, Ltd., 117, Central Street, E.C.1.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

ALFRETON (Derbyshire).—Primitive Methodist church, school, &c. (£30,000); R. Watchorn (donor).

ASHFORD (Kent).—Nurses' home, for East Ashford Board of Guardians; E. A. Jackson, architect, 13, North Street.

BARNSLEY.—School, Ardsley, for the borough E.C.; Dyson, Cawthorne & Coles, architects, 10, Regent Street.

BRADFORD.—Seven-storey block, offices and shops (£230,000); city architect, Town Hall. Mental hospital, Westwood estate (£260,000); city architect. Filter pressure house, Bingley; Thos. Obank & Son. Police headquarters; city architect.

BRISTOL.—Reconstruction of Palace Picture Theatre; G. H. Blackburn, manager; F. Verity, architect, London. Cinema on site of St. George's Hall, for J. Pugsley; W. H. Watkins, architect, Clare Street. Institution for mental defectives, for the T.C.; borough engineer. Doubling railway at Avonmouth Docks; city engineer.

CARLISLE.—Additional 300 houses, for the T.C.; borough surveyor. Warehouse, Caldergate; J. Leslie, architect. Stores, James Street; Hodson, Scott & Sons, Ltd.

CARNARVON.—Conversion of Sportsmen's Hall into town hall and municipal offices, for the T.C.; Arthur Hewitt, architect, Llandudno.

CHIPPENHAM.—Rectifier shop, for the Westinghouse Brake Co., Ltd.

CHISLET (Kent).—Additional 100 houses, for the Chislet Colliery, Ltd.

CLECKHEATON.—Works, Moorend, for the Killgerm Co., Ltd., chemical manufacturers, and Messrs. John Sharp, wire manufacturers (£16,000).

COATBRIDGE.—Shops for Clarkston Co-operative Society, Ltd.; Mr. Moffat, manager.

CREDITON (Devon).—Housing scheme (25), for the U.D.C.; surveyor.

DOUGLAS (I.O.M.).—Stores, Fort Street; Todhunter and Elliot, Ltd. Church, Hilary Street; Christian Science Society.

DUDLEY.—Extensions, mattress factory, Stourbridge Road; F. Flanagan. Additions, Grammar School; governors. Isolation hospital, for the T.C.; borough engineer.

EPSOM.—Housing scheme (38), for the R.D.C.; F. A. Pratley, surveyor, Ashley House.

FURNESS DISTRICT.—Alterations to Leven Valley Co-operative Stores; J. A. Wilson, The Glen, Backbarrow.

GOLDTHORPE (Doncaster).—Church hall, to seat 500, for the Wesleyan trustees; Sir Alfred Gelder, architect, Hull.

GOSPORT.—School (£18,000) at Brockhurst; secretary, Education Committee.

GUISBOROUGH.—Central schools, for North Riding E.C.; director of education, Northallerton.

HAMILTON.—Coachbuilding and repair works for Messrs. Metcalfe, coachbuilders, of London and Romford; local representative, 26, Bothwell Street, Glasgow.

HAMPTON.—96 houses, Priory Road; U.D.C. surveyor.

HASTINGS.—Additions, Fairlight Sanatorium, Old London Road; Eigood and Hastie, architects. Concert pavilion, Central Cricket Ground; A. Wallis.

HAYWARDS HEATH.—Proposed installation of electric lighting in St. Wilfred's Church; Parochial Council.

HULL.—Central public library extension (£14,000); city architect.

KESWICK.—Town hall, Main Street, for the U.D.C.; surveyor.

KIRKCALDY.—Bakery for Kirkcaldy Co-operative Association, Ltd.; the manager.

LANARKSHIRE.—Picture house at Carluke; M. Burns, manager. Church building at Allanton (£2,200); Rev. J. Cromarty Smith, Coatdyke.

LEITH.—Town hall and library; Bradshaw, Gass & Hope, architects, Silverwell Street, Bolton.

LONDON (East Ham, E.).—Additions, East Ham shopping hall, Myrtle Road; East Ham Shopping Hall, Ltd. Alterations, 255-9, Katherine Road; H. Blackman.

(Ilford, E.).—Distributing depôt, High Street; United Dairies, Ltd.

(Islington, N.).—Extension, municipal buildings (£48,000); Borough Council architect.

(St. Pancras, N.W.).—Buildings, Pratt Mews, Bayham Street; W. A. Rutter, architect.

LINCOLN.—Church, Addison Drive, for the Wesleyan trustees.

LOWESTOFT.—Electric car house, London Road South; E. J. Ford.

LYMINGTON.—34 houses (£15,099); C. T. Webb, Beaulieu, New Forest, contractor.

MANSELTON.—50 houses, G.W.R. Garden Village Society, Ltd., Swansea.

MERTHYR.—Pavilion, Aberfan; Miners' Welfare Fund.

MUIRKIRK.—Remodelling and extending Furnace Road Higher Grade School, with electrical work, for Ayrshire E.C.; William Reid, master of works, Education Offices, Ayr.

NEWARTHILL (Holytown, Lanarkshire).—Re-erection of 'bus garage, for Messrs. Brown (£5,000).

NEWTOWN.—Smallpox hospital; Worcestershire C.C.

NORTHAMPTON.—46 houses, Weedon Road site; A. Glenn and Sons.

OLDBURY (Birmingham).—Public baths with public hall (£16,000), for the U.D.C.; surveyor.

OTLEY.—30 houses, Bradford Road; O'Brien & Richmond.

OXFORD.—New kitchens, Oriel College, Magpie Lane; trustees. Students' rooms and extension of kitchen, St. Margaret's Road; St. Hugh's College trustees. Library, St. Aldate's site; Library Committee of Corporation. Two secondary schools; Education Committee. Additions, warehouse, Red Lion Square; Elliston and Cavell, Ltd.

OXFORD.—Two secondary schools, for the City E.C.; Director of Education. Additional housing scheme, for the T.C.; city surveyor.

RICHMOND (Yorks.).—Church, Catterick Camp (£15,000), for the Wesleyan trustees; Arthur Kellett, architect, Barnard Castle.

ROCHFORD (Essex). Additional housing schemes (92), for the R.D.C.; surveyor.

SANDWICH.—Additional 30 houses, for the T.C.; borough surveyor.

SCARBOROUGH.—Picture house, Westborough, for the Londesborough Theatre and Picture House (Scarborough), Ltd.

SLOUGH.—Station extensions (£20,000); Great Western Railway Co. Church, Bath Road, for the Wesleyan trustees.

STANDISH (Wigan).—Cinema and shops, High Street, for E. Bentham. Cinema, Preston Road, for J. R. Horrocks.

STIRLING.—Conversion of infirmary into headquarters' offices and meeting place for Stirlingshire Education Authority; the clerk.

STOCKTON-ON-TEES.—Extensions, Globe elevator works, for Pickering, Ltd.

STROUD (Glos.).—Nurses' home, General Hospital; A. Linton Iredale, architect, Park Road.

SWANSEA.—100 houses; borough architect.

SWINDON (Wilts.).—Church, Hurst housing estate; Rev. E. R. Knapp, vicar of Redbourne Cheney.

THORNABY-ON-TEES.—School (£10,000), Westbury Street, for St. Patrick's Catholic church; Rev. Canon D'Hooghe.

TROON.—Masonic temple, hall and shops, Portland Street (£4,000); J. R. Johnstone, architect.

TRURO.—Additions, Truro College; trustees. Oil depôt, Newham; Russian Oil Products, Bristol.

WALSALL.—Additional housing scheme (500), for the T.C.; borough surveyor. School, Blakenhall (£9,570), for the borough E.C.; borough surveyor.

WARRINGTON.—Housing scheme (30), Reynolds Street estate, for the T.C.; A. M. Ker, borough engineer. St. Oswald's Church, Padgate Lane (£4,000), for Rev. Father Hind; Wright & Hamlyn, architects; John Dolan, builder. Extensions, Palatine Works, Causeway Avenue; Fletcher, Russell & Co., Ltd. Pavilion, Causeway Avenue; Regals, Ltd. Pavilion, Greenalls Avenue; Greenall, Whitley & Co., Ltd.

WATFORD.—50 houses, Leggatts Rise Estate; Kempster and Williams. Joiners' shop, sawmill, garage and offices, Beachwood Rise; Kempster & Williams.

WEYMOUTH.—Electric light installation, borough sanatorium (£400), for the T.C.; town clerk.

WINCHESTER.—Drainage scheme with pumping stations, for the T.C.; John Taylor & Sons, engineers, Caxton House, Westminster, London, S.W.

WINDSOR.—Bazaar premises, Peascod Street, for F. W. Woolworth & Co., Ltd., Kingsway, London.

YORK.—Extensions, Secondary School, Nunthorpe; Education Committee.

INDEX.

Notes and Comments.

trical Retail Trade.

hile it is true that a very large proportion of the ical material used by the domestic consumer es him through the medium of the electrical con- or, it is equally certain that some millions of ds' worth of such products are passed to the public the counter of the ical retailer who lays laim to being a "con- or."

at do we mean by an ical Retailer? The word iler" has essentially a keeping meaning in the f every-day commodities, n the electrical trade it eceived official recogni- In case the shopkeeper is selling electric lamps ittings and shades, fires acuum cleaners, wireless atus and valves, as well trical toys of manifold asks how it has hap- that this official recog- has been given, we may for his information the in which the organised tion of electrical contractors recently described

* * *

Electrical Retailer" Defined.

activities of the association referred to (The cal Contractors' Association, Incorporated) are own as well as they might be among the smaller al contractors and dealers, so we may pardonably state that when that body drew up a trading policy a few years ago it started a new section to provide for Electrical Retailers, who, through their membership of the section, should participate in such retailers' trading advantages as were already secured by the Electrical Contractors' Association for their full Contractor members. More may be said respecting those advantages at a later date. An "Electrical Retailer" was defined in the following terms:—

"A person, firm or company with shop or showroom premises and equivalent, suitable for a Retail Trade, or equivalent facilities for resale, who carries a substantial and varied stock of electrical goods and sells the same to the user."

It was added:—

"Although the two businesses are very commonly combined they are not really identical; and while it is generally desirable that an electrical contractor should also be an Electrical Retailer, there are, and always will be, a large number of Electrical Retailers who are not Electrical Contractors and would gain no advantage by combining that business with their own."

* * *

Ourselves and the Retailer.

In addition to this, usage in the electrical trade has caused the term "Electrical Retailer" to be thoroughly established amongst us, and it is because we recognise the great value of this class of electrical trader as a

Selling Lines for Retailers (illustrated) ...

medium through whom vast supplies of electrical goods must be passed on during the coming years, that we have decided to devote this Supplement to the matters with which he is particularly concerned. The widest possible meaning will be given to the word retailer in preparing the matter that is to appear in these pages, for electrical, including wireless, goods to-day form a considerable line of trade for ironmongers, hardwaremen, stores, and various shopkeepers who do not lay claim to be primarily either electrical retailers or contractors. To such we hope to be able to give up-to-date information regarding articles in which a market can be made among the general public by anybody prepared to sell them. The public interest in electricity and all that can be done with it in the home has led to the electrical shop-keeper being bombarded with all sorts of inquiries. If he is alive and alert he has already recognised that he must gather together from some direction or other not already accessible to him, information which will qualify him for turning *all* inquiries to good account. It is our intention to render him assistance of this character periodically by means of this Special Supplement, and we invite suggestions regarding ways in which we can do so.

We cannot be sure that a horse taken to the water will drink, but we intend to fill the trough by bringing together notes and pictures describing electrical articles suitable for over-the-counter trade, and discussing some of the problems which are bound to arise in connection with a retail business. In our opinion it must be of untold value to the electrical dealer or trader to be brought into closer touch with others in the electrical industry and to be regularly informed of what they are doing. He will thus get to know what to buy, when to buy, how to buy, how to avail himself of facilities for securing the best terms and conditions from manufacturers and from the wholesalers in the trade, and many other things.

* * *

The Great Electrical Campaign.

One of the curious facts in the present situation is the remarkable lack of knowledge amongst electrical retailers of the great Electrical Campaign that has been in progress in most parts of the United Kingdom since last September. The electrical shopkeeper or the small contractor who has not joined in this effort does not know what he is losing. Some contractors and traders have reaped substantial orders because the public interest has brought new customers into their shops. During the next few months every retailer should try his best to further stimulate the public interest in the scheme not merely because he will thus be assisting the general electrical movement, but because he can add immediately and definitely to his own trade turnover. We print on a later page a message from Mr. J. W. Beauchamp inviting the full co-operation of retailers in the remaining stages of the campaign.

* * *

Two Important Events.

All who are interested in the sale of electrical goods of the smaller kinds, including domestic appliances, wireless devices, and so forth, must keep in mind two events which will afford them excellent opportunities for inspecting many examples of such products and at the same time enable them to discuss prices and business points regarding them with representatives of the manufacturers who desire to explain to buyers their features of interest. At Birmingham, from Monday, February 21st, until March 4th, a large number of such exhibits will be on view on the of some seventy or eighty makers, at the British tries Fair. This Electrical Section will be a market where live men will be found for the twelve days ready to receive electrical traders h small or large their requirements may be. The trical part of the Fair has grown in size and i in recent years, and this time it will contain a co power plant provided by 30 different manufac acting in co-operation. Electrical shopkeepers have not already received the Invitation Vouche was circulated with the Electrical Review on I ber 31st should apply to the Editor of the Elec Retailer and Dealer, 4, Ludgate Hill, London, at once, as it carries with it the right to r travelling rates, which we feel must be an inducement to electrical buyers to undertake the j to Birmingham. Then in London, there is brought together a large collection of wireless app and material, electric pocket lamps of all kinds trical glassware, instruments, and other things t not come within the Birmingham category. The event to which we wish to direct attenti the Ideal Home Exhibition, which takes pl Olympia, London, from March 1st to 28th. He usual, it will be possible to see many interestin trical articles employed in the illuminatio domestic equipment of the modern home. These bitions are annual fixtures, and there will be n else like them until 1928.

* * *

What Do You Want to Know?

For the convenience of anybody and eve in the electrical trade who wants to know thing about anything electrical, we have a S Department which is prepared to go to endless trouble—in reason, of course—to hel out of your difficulties. We think that if a can answer your questions we can do so. Your mers want a special brand or design of switch, fitting, oven, or some other member of the ele family, and you do not know off-hand that y obtain it for him. You don't know either the or the trade factor. Don't tell him that yo supply it, or try to put him off with something doesn't want—ask him to call again, and interim approach us. If we know it, we will gi a reply at once in your own stamped envelope. we can at least promise to find out, and w promise such a thing—well, in 90 per cent. of th we fulfil our promise. That the electrical tra cannot possibly keep in his mind, if it ever fo way there, the special name of every electrical accessory or other article introduced, is the most thing in the world. It has long been recognis there must be some central authoritative bureau all such information would be kept on file ready t out to the inquirer. Years ago we published section of a Directory, the discontinuance of wh came necessary under the stress of war condition day we publish the special Trade Names of number of electrical articles, by arrangement wit manufacturers or factors, as a Quarterly Supple the Electrical Review.

* * *

Something for Nothing!

It is not supposed that every busy retailer wi the time, even if he possess the ingenuity and to design a striking leaflet or advertisement. F

...e it to the printer who *may* know more about it ... produce something better than the majority of ...ers would do for themselves. But there are ...r courses open to the average man. The manu...rers who prepare lists by the half million or ...ion at a time, for circulation by the trader, can ...d to have a good man producing a good design ...n gets home straightaway and effectively. Let the ...ler write for a batch of these and he will receive ... with space for inserting his own name and address; ...bly even these will be printed in for him free of ...nse. Another practice which we strongly recommend ... study of the excellent and very varied publicity ...ts and advertisement designs prepared by the ...sh Electrical Development Association, of 15, Savoy ...t, Strand, London, W.C.2. This Association's ex... have prepared electrical publicity literature deal... with almost every conceivable domestic and other ...f electricity, and a close study of their work can ...y fail to stimulate the minds of retailers who are ...arch of ideas for making their own local efforts ...essive.

* * *

...le Literature.

...nufacturers and wholesalers of electrical products, ... as lamps and lighting fittings and accessories, ...ic fires, cooking apparatus, vacuum cleaners, ...ng machines, electric refrigerators, and a great ...ty of wireless apparatus and parts, have issued a ...of excellent catalogues and price lists which should ...ured by readers of these pages who are anxious to ... themselves abreast of the times. We suggest that ...ers write for copies at once after they have seen ... referred to here, as such literature is very helpful ...eal trade purposes. Among catalogues recently ...ed we may mention a comprehensive one from the ...sh Thomson-Houston Co., Ltd., covering a very ...range of its wiring supplies and domestic appli...; the company has since published a miniature ...n of this 150-page catalogue—it is for pocket ... measuring $6\frac{1}{4}$ in. × $4\frac{3}{4}$ in., and is an exact ...a. The General Electric Co., Ltd., which is ...ntly issuing trade catalogues and lists for the ...uctor relating to its varied electrical products, ...laced before us a pamphlet on electric appliances, ...r running costs thereof, and a catalogue of ...ophone" wireless receiving sets, components, and ...ories. A three-colour window poster of "Cosmos" ... has been prepared by Metro-Vick Supplies, Ltd., ... a booklet particularises and prices ten types of ... valves. The Sun Electrical Co., Ltd., has ... folders dealing with a number of domestic elec... appliances and electro-medical apparatus and a ... blue catalogue (472 pages) of "Everything ...ical." A full catalogue by Messrs. A. P. Lund... & Son regarding the "Lektrik" plug connectors, ...ors, and other accessories such as they have been ...ing to the trade for so many years, is also among ... productions.

...s for the Electrical Contractor.

... best recently published book for study by elec... tradesmen who contemplate branching out into ...al installation work is that written by Mr. ...res Purdie. Those already engaged in the ...ting business in a small way would also find it ... if they are making preparations for launching ... a larger scale. There is plenty of work avail... able and far more in prospect now that the electrical movement is spreading so rapidly. Mr. Purdie's book is described as "a guide and handbook specially designed to meet the needs of all those engaged in business as electrical contractors." It can be obtained from our "Book Department," 10s. 6d. net (plus 6d. postage). Another book which is being widely used and is constantly in demand is Mr. Donald S. Munro's well-known handbook on "The Practice of Electrical Wiring." This is a standard work by an expert, containing a great deal of information which is invaluable to contractors, wiremen, and all using installation material. In its enlarged edition form its price is 5s. 4d. post free. This can also be obtained from our "Book Department," which will likewise be pleased to forward any other electrical books on receipt of orders and remittances. The works mentioned we commend to the electrical retailer and contractor for his personal use, but there is a large variety of small popular booklets that he can stock for sale to his amateur wireless workers and electrical experimenters.

* * *

Electromedical Apparatus.

One of the most profitable lines to which retailers should devote attention is that of electromedical apparatus for home treatment; nevertheless, it appears that little has been done to develop this fertile field—whether because the retailer is unaware of its possibilities, or because he hesitates to plunge into the mysteries of therapeutics. That it *is* a fertile field we have demonstrated to our own satisfaction; there is a lively public demand for apparatus of this description, which is rapidly growing, and is being stimulated by the frequent references of writers on medical subjects to the virtues of ultra-violet rays and high-frequency currents. Moreover, the manufacturers of such apparatus have not been slow to meet the demand—a remarkable variety of appliances has been placed on the market. It only remains for the retailer to complete the chain between the manufacturer and the purchaser by stocking the apparatus and promoting sales.

Such an opportunity has rarely come his way: we strongly recommend him to seize it. For that purpose we have devoted much space in this issue to an account of the nature of ultra-violet rays and high-frequency currents, and a series of illustrations of the appliances that have been evolved, with a view to assisting the retailer to take advantage of this opening. In later issues we propose to deal on similar lines with radiant heat treatment, electrical vibrators, ozonisers, &c.

Those who are interested in this subject and wish to follow it up will be pleased to learn that a course of lectures will be commenced in March for the instruction of any members of the electrical trades who intend to handle "artificial sunlight" lamps commercially. These lectures will be delivered by Mr. J. W. Mason, F.B.O.A., F.I.O., the manager of the electrical department of one of our largest manufacturers of chemical and surgical apparatus and supplies, who conducts regular courses of lectures to members of the medical profession, masseurs, and nurses; they will relate especially to the nature, production, and effects of ultra-violet rays, and will include the demonstration in operation of all kinds of apparatus used in this connection. Thus the retailer will be afforded a unique opportunity of gaining that practical working knowledge of the subject which is essential if he is to make the best use of this new opening for trade.

A Campaign Message to the Retailer.

By J. W. BEAUCHAMP.

Director and Secretary of the British Electrical Development Association, Inc.

THE retailer of electrical service, whether his particular commodity is units or appliances, has no lack of reasons for approaching the householder to-day.

Sometimes, however, one wants something more than a reason, an excuse at least in making the first contact with strangers.

Using the term Retailer in its widest sense to cover those who sell power, wiring or appliances, the E.D.A. has, since October, offered the best excuse the retailer has ever had for approaching this particular field of business. No fewer than 2,500 have taken advantage of the E.D.A.-E.L.M.A. national scheme for the better lighting of the homes of Britain and already, through the activity of these retailers and in their shops and showrooms, half a million of the public have fallen for this advertising campaign, and learned from it a good deal they did not know before about the use of electric light in their homes, and the possibilities which electricity offers to them in every district for some greater or less convenience and comfort in household working.

The numerous reports sent in to E.D.A. offices, and raised at meetings up and down the country, reveal that the campaign is achieving its object, increasing sales, multiplying the rate of new connections, and offering the great advantage of bringing together people in all sections of the Industry in a way which will be more useful as the years go by, and for future campaigns of electrical work which may be decided upon.

If there is to-day any contractor, retailer or electricity supplier who does not know all about the present E.D.A. campaign, a postcard to the head office w bring him that information within a few hours, a in such form that he will find himself up to da four months late it is true, but yet with two mont in which to do something in connection with the ca paign, to the benefit of his own business and the gene betterment of the whole industry.

The writer would particularly ask all readers this paper, in the months of February and Marc to do their individual and collective best to use th campaign, known in the trade as W.O.B., a vigorc tree of national development from some bran of which everyone in this business can gather a harv of present work and future prospect.

A contractor, who had derived benefit from this wo remarked a few days ago at a local meeting "*t business impetus produced by this campaign is lik to continue for at least a couple of years ahead.*" the other hand, there can be no certainty that as t years go by, those who provide the national fun that are being spent by the Association will rema content to put forward campaigns which, by the nature, permit everybody in the industry to secu benefit at little trouble and irrespectively of wheth they are bearing their share in the cost of the prop ganda and industry protection work that is bei carried out by the Association.

Half-a-million people have already called at ret shops and showrooms, to secure their copies " Electric Lighting in the Home "—please assist E.D. and yourself, by a liberal distribution of this publi tion before the campaign ends on March 31st.

* * *

Market Development.

A "Four-Star" Plan for Retailers.

By W. E. BUSH.

IN the many articles which have appeared in the electrical Press, the subject of electrical retailing has been exhaustively dealt with from specific and specialised aspects such as shop window dressing, interior display, advertising and publicity methods of all kinds; in fact, every kind of advice that might be employed to assist a retailer in obtaining a larger share of the available electrical business has been freely given.

I propose therefore in this article to approach the subject from a somewhat wider angle than the consideration of the several factors that go to the making of a successful individual business, and to suggest a plan for stimulating development on a co-operative basis. The essentials for development in the domestic field can be divided under four main headings:—

1. Education of public.
2. Reasonable energy rates and simple tariffs.
3. Adequacy of wiring installations.
4. Moderate prices for electrical equipment.

Of these four headings the third is probably the m in need of immediate attention. The price-cutting w that has been in operation amongst the smaller co tractors in recent years has resulted in a very po standard of wiring, both in regard to quality a adequacy. The majority of houses are wired wi the fewest outlets possible. This automatically lim the market for the future retailing of electric appliances. To correct this handicap, and to stimula progress in the other avenues of development stat above, I suggest the following activity to be know as the "Four Star" Plan.

(*a*) In every district a committee representing t electrical contractors and the central stati authority, should be set up. (Such committe already exist in the many districts where W.O. circles have been formed.)

The committee shall decide the Star category in which the district shall be grouped, based on the economic advantages of using electricity for domestic purposes in that district.

"One Star" denotes Lighting only.

"Two Star" denotes Lighting and Appliances.

"Three Star" denotes Lighting, Appliances and Heating.

"Four Star" denotes Lighting, Appliances, Heating and Cooking.

The factor which will chiefly govern the grade of a district is the charging rate for electricity and the form of tariff, although special circumstances, such as over-loaded mains, should also be taken into consideration. A district in which the rate is say 10d. for lighting, and 4d. for power, could not be economically rated at higher than "Two Star," whereas 6d. and 2d. respectively would probably just come within the "Three Star" category. All two-part tariffs, with a reasonable fixed charge and unit rate of one penny downward, could well be classified as "Four Star" districts.

Having fixed the "bogey" for the district, the committee will proceed to draw up a specification of wiring outlets for various sizes of houses, according to Star classification, ensuring that a liberal number of wall plugs are provided and that the wires are of ample size for future development.

(*d*) The next step should be an endeavour to persuade all contractors to quote on the "STAR" specification when submitting estimates. This may at first be difficult but should become easier as the effect of paragraph (*e*) increases.

(*e*) The many advantages of living in a Two, Three or Four Star house, as the case may be, should be constantly brought to the public attention by advertising, exhibitions, demonstration houses, &c. Builders developing new estates should be made to see the advantages of featuring the electric Star programme, as a selling point. The competitive or envious spirit should be encouraged amongst the public so that Mrs. A would not be content with her "Two Star" installation, if Mrs. B's house was "One Star" higher.

It would probably be desirable that a standard poster of registered design should be available for advertising the scheme, and some control from a central headquarters would be advantageous. Such a plan, if put into operation, should serve as a stabilising force for quality and price of work which would tend to stimulate progress in the more backward districts, and would fix in the mind of the public a "hall mark" of household electrification.

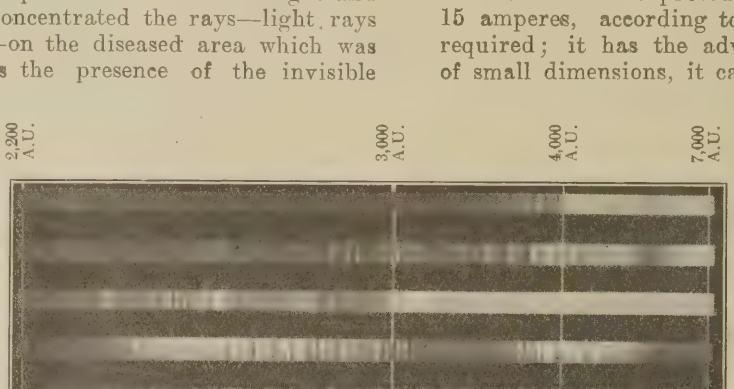
* * *

Electromedical Appliances for Home Treatment.

HE curative properties of electricity have been known for many years—as long ago as 1755 they were lauded in a London magazine in con-on with "disorders of the rheumatic and paralytic "—and during the past quarter of a century very t progress has been made by way of experimental rch in the study of the most effective methods of sing them and of the results obtained. No hospital days can be regarded as fully equipped unless it ovided with an elaborate and costly installation of ical apparatus for the treatment of disease, for graphy, for special methods of illumination, and numerous minor purposes in which electricity is r an indispensable accessory than a principal . Many consultants also have provided themselves similar equipment for use in their private prac- with excellent results; but it is only within quite t times that electrical treatment in the ordinary hold has become comparatively common-place, and eased to bear the stigma that is attached to quack ines. Over 30 years ago a great deal of mischief done to medical electricity by the operations of n persons who foisted on the public "electric " which, in point of fact, produced no electricity , but which were extensively advertised as effect- xtraordinary cures, and were certainly sold at an rdinary profit; the Electrical Review, at the f several actions for libel (all of which it won), ainly instrumental in putting an end to this ture, but could not so readily remove the stains the fair fame of the science of electrotherapeutics, was then in its infancy.

However, by the efforts of the enthusiastic investigators who, undaunted, persevered in their endeavours to develop the use of electricity in the cure of disease and to establish this mode of treatment on a sound basis of ascertained fact, and by the convincing evidence of successful results, the lost ground has been far more than regained: as we have said, the merits of electrical treatment are now universally recognised in professional circles, and the general public is beginning to demand a share in its benefits, without the necessity of attending hospital or surgery.

1.—Ultra-Violet Radiation.



One of the most powerful factors in restoring the prestige of electrotherapeutics was the invention of the "Finsen light" treatment for lupus and similar skin diseases, and its adoption at the London Hospital in 1900, thanks to the interest of Queen Alexandra; another was the discovery of the X-rays by Röntgen in 1895. The circumstance that both of these factors depend entirely upon the use of ether waves or vibrations identical with light rays in all respects save that of wave-length is significant in more ways than one, as we shall show.

In the first place, all ethereal vibrations, which are electromagnetic waves, are identical in form and differ only in frequency, and therefore in wave-length. The vibrations which give rise to the sensations of light and colour occupy only a trifling proportion of the great scale which extends from the longest waves used in long-distance wireless-telegraphy—some 30,000 metres (about 19 miles) in length from crest to crest—to the infinit-

esimal waves which are known as the "gamma rays" of radium. Next to the latter come the X-rays, and between these and the shortest visible (violet) light rays come the "ultra-violet rays." Passing through the green, yellow, and red light rays we come to the "infra-red" or pure heat rays, which are followed by the Hertzian and wireless waves. Wave-lengths, shorter than those last named, are usually measured in terms of the "Angström unit" (A.U.), one ten-thousand-millionth of a metre in length; the softest (*i.e.*, longest) X-rays are one A.U. in wave-length, and the shortest visible violet-rays have a wave-length of 3,900 A.U. From 3,900 A.U. down to about 2,000 A.U. comprises the region of "ultra-violet" rays with which we are here especially concerned; shorter waves than these are so quickly absorbed by the atmosphere that they cannot be used in electrotherapeutics.

Ultra-violet rays are almost completely absorbed by glass of ordinary composition (recently a new glass known as "Vitaglass" has been invented, as the result of research, which permits a large proportion to pass through), but pass freely through transparent quartz. The essential features of the Finsen light apparatus were the use of a very powerful electric arc light and a quartz lens, which concentrated the rays—light rays and ultra-violet rays—on the diseased area which was to be treated. It was the presence of the invisible ultra-violet rays that brought about the cures of lupus for which the Finsen light became famous.

Natural sunlight contains ultra-violet radiations, but in the smoky atmosphere of towns little of this reaches the level of the streets. On high mountains, on the other hand, where the air is pure, dry, and free from dust, the U.V. rays are present in quantity, and long ago the curative properties of sunlight under such conditions were recognised. Finsen's great invention consisted in finding an artificial substitute for the natural ultra-violet radiation of the sun. But whereas sunlight was applied by exposing practically the whole body to the healing rays, the Finsen lamp concentrated the radiation upon a small area. It is now known that the curative action of ultra-violet rays is not confined to the area irradiated—in some way they act upon the blood itself, so that if part of the body is exposed to the rays, the whole organism derives benefit therefrom. This discovery has profoundly modified the methods of treatment. Whilst local application is highly efficient in skilled hands, employing powerful apparatus, it is not suitable for use except under expert supervision. General irradiation, however, can be practised with safety by anyone, provided that the ultra-violet rays employed are not too intense, that the subject is not too near the source of the rays and that the exposure is not unduly prolonged; and such treatment is capable of producing remarkable results, as will be seen. But first it is desirable to describe the apparatus by which the rays are produced.

Spectra by Dr. Judd Lewis; reproduced from "Ultra-Violet Therapy," by W. E. Schall, B.Sc.

One of the most fertile sources of ultra-violet r the mercury vapour arc, which has long been use lighting purposes—usually in glass tubes, which pr the emission of the U.V. rays; when the arc i closed in a quartz container, these rays are pro in abundance, over a wide range of wave-length. a device must be classed as somewhat dangero unskilled hands, though it is very efficient when ap by trained operators under professional supervi the mercury arc, therefore, is not likely to be w used in domestic circles.

Next in order is the tungsten arc—an arc s between tungsten electrodes, as in an ordinary arc l Whilst perhaps less powerful than the mercury the tungsten arc is an excellent source of U.V. ray spectrum containing wave-lengths down to 2,130 A.U. Both from practical considerations regard to construction and operation, and from point of view of therapeutic effectiveness, the tungsten lamp is probably the best and most conve appliance; but it has one important limitation—i burn only with direct current, and if the local tricity supply is alternating, rectifying apparat some sort must be provided. The arc takes from 15 amperes, according to the intensity of radi required; it has the advantage that, being a s of small dimensions, it can be accurately focused reflector, w if coated silicon, re 75 per cen the U.V. that fall up

A third s of ultra-v rays is an tric arc be carbon trodes. If bon only is the U.V. r tion is weak, but providing carbons special cores, containing salts of tungsten, ni or iron, it can be greatly intensified. This for arc lamp, which burns on either a.c. or d.c., ap to be by far the most suitable for the purpose of treatment; it is simple in construction and opera and moderate in price, and whilst it produces a amount of ultra-violet rays, it is not nearly so pow as the mercury and tungsten lamps—consequent may be regarded as free from danger to the pat Many patterns of U.V. lamp can be used alternat with either cored carbons or solid tungsten electro provided, of course, that direct current is availabl the latter—and they are accompanied by resist which enable them to be fed from public supply m at any voltage that is used for domestic purp Some of them are described and illustrated below.

It remains now to deal with the uses and effec ultra-violet rays—but briefly, for this raises phys gical questions which can only be fully treate medical experts. The first effect observed as the r of U.V. radiation of sufficient duration and inte is a reddening of the skin, styled "erythema": is the indicator by which the effect of the treatment be (roughly) measured. It shows that the capi

Announcing

VOLTA

THE COMPLETE HOUSEHOLD CLEANER

Are you prepared to meet the demand for a protected dust-bag Cleaner?

I introduced this type into the country and established its popularity.

Now I offer you a Cleaner of this design in its latest and most advanced form.

I wholeheartedly recommend it as the soundest selling proposition in domestic Cleaners ever offered to the trade.

Write to me for full details, and have your stock in time for the Spring demand.

Managing Director,

VOLTA LTD.
Kern House, 36-38, Kingsway,
London W.C.2
Telephone: Holborn 0288.

The Vacuum Sweeper.

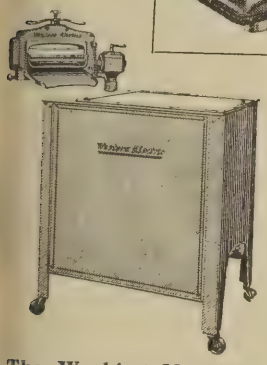
The Domestic Iron.

Standard Telephones and Cables Limited (formerly Western Electric) invite your enquiries for Electric Domestic Appliances of outstanding quality

The Vacuum Sweeper.

A machine that has many points of advantage over other machines of this type. Cleans both by slowly revolving brush and suction or by suction alone. Special attachments for all cleaning purposes, including polished surfaces.

The Washing Machine.



Constructed entirely of metal with revolving and reversing perforated cylinder. Wringer locks in any of eight positions, has rubber-covered rollers, and can be operated simultaneously with washer if desired.

The Standard Cabinet Ironing Machine.

A machine of outstanding efficiency combined with simplicity of control, a beautifully finished appliance that must be seen to be fully appreciated.

The Domestic Iron.

One of the best on the market, highly finished, and supplied complete with 6 ft. non-kink cord and ironstand.

The Washing Machine.

The Cabinet Ironing Machine.

The Vac Mop.

Agents are required in the West Country and South West Coast. Please write for particulars of sales helps, discounts, etc., to Dept. 65.

Standard Domestic Appliances

Every week more than 1,000,000 Rawlplugs are fixed in England

For every fixture in the largest city buildings or the most modest bungalow, electricians throughout the country are now using tens of thousands of Rawlplugs every week. Not only do Rawlplugs enable them to make neater and firmer fixtures than if the old-fashioned wood plugs were used, but they save 50 per cent. in time and the whole of the cost of making good. Millions of Rawlplugs are used annually by the Admiralty, War Office, G.P.O., Principal Railways and Electrical Contractors everywhere.

Illustrated 20 pp. Hand Book on Fixing (free).

RAWLPLUGS

THE RAWLPLUG CO., LTD.,
Cromwell Road, London, S.W.7.

B 8

A RAWLPLUG AND SCREW GAUGE FREE

We have designed for the special use of the Electrical Trade a handy little Plug and Screw Gauge which will enable you to tell immediately the diameter size of any Screw or Rawlplug you may wish to use. We shall be glad to send you this *free of all cost* on application.

(*Continued from p.* 6.)

circulation has been stimulated and that the rays taking effect. Too strong or too long a dose lead excessive erythema, which may be accompanied irritation of the skin, but is not necessarily harm As the erythema does not appear until some hours a the irradiation, it is wise to begin with small d and gradually increase them.

The next effect that is visible, after regularly repe doses in moderation—it may be daily, or two or t times a week—is "pigmentation," which is practic identical with sunburn; both pigmentation and str erythema are liable to be followed by peeling of skin (desquamation), but this is not a serious matt though it suggests a warning to diminish the dose future applications.

These are the external appearances, and are superficial; the real beneficial effects of ultra-v radiation are constitutional, and may not be sen until the treatment has continued for days or we As we have said above, we do not propose to enl upon a medical discussion which we are not compe to handle, but on the highest professional authority can confidently assert that the radiation has g curative power in connection with certain disease the skin, the healing of wounds, the loss of hair, it is of great value in the treatment of the var disorders commonly classed together as "rheumatis *e.g.*, lumbago, neuritis, and arthritis; it reli nervous depression and neurasthenia; and it is effe in pulmonary tuberculosis and catarrhal condition the respiratory organs, including bronchitis asthma. The cure of rickets is one of its most not claims; numerous clinics have been set up for the t ment of rickety children, with a large measure of cess. Even where no active disease is present, g benefit has been derived from the use of U.V. radia which appears to stimulate and refresh the w organism, both physically and mentally. Hence have no hesitation in urging the claims of apparatus to an honoured place in every electrical s the more so since we know that the public is eag possess it.

For the help of those who wish to pursue the s of the subject further than is possible in this sketch, we append a short bibliography of reliable up-to-date works. We also strongly commend to reader's attention the excellent bulletins which issued by some of the makers of electromedical app tus, particularly the following:—

"Ultra-Violet Therapy," by W. E. Schall, B F.Inst.P. (Schall & Son, Ltd., 75, New Caven Street, London, W.1.)

"Sunlight in the Home," by J. W. Mason, F.B.(F.I.O. (Arnold & Sons, 50-52, Wigmore Street, W

he "Solart" U.V. Lamp.

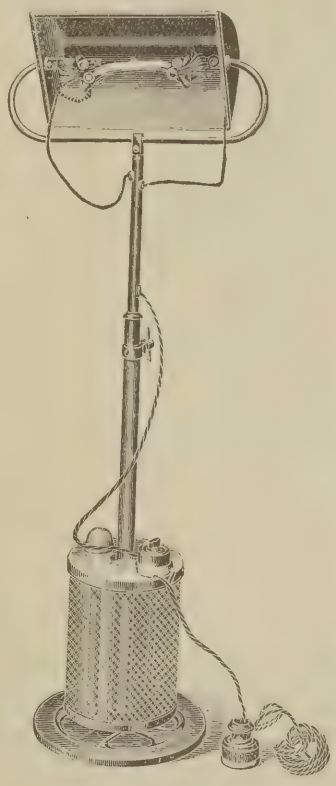
The "Solart" lamp for ultra-violet radiation is of e automatic type, mounted with a parabolic hood flector on a floor stand; the automatic burner is adily removable from the hood, and the carbons, ich are of a special metallic-cored type, are easily ewed. An electromagnetic blow-out is provided

"Solart."

"Alpine Sun."

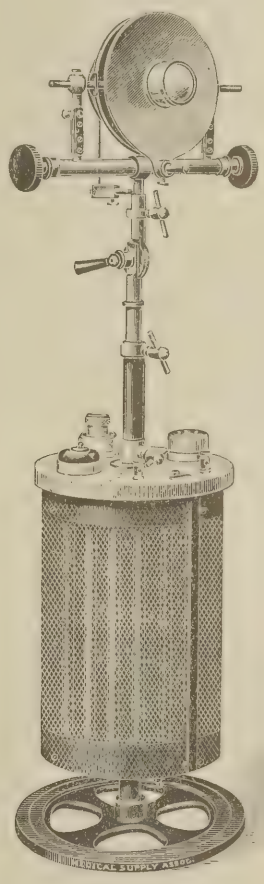
h ensures the extinction of the arc when the car- are too short. The hood is fitted with hooks, at it can, if desired, be suspended from a bracket rom the ceiling; and a front plate is provided h limits the area irradiated, and to which a ising tube can be attached. These features, with resistance and control board, are shown in the npanying illustration. (*I. Calvete, Ltd.*, 11, e St. Andrew Street, W.C.2.)

* * *



"Alpine Sun" Lamp.

e Arnold U.V. lamp for home use consists of a twin lamp, burning carbons cored with a special com- pound of rare earths and metals, which give a spectrum closely resembling that of the sun and rich in ultra-violet rays. The lamp is mounted on a white enamelled stand, with all bright parts nickel-plated; it takes 5 or 10 amperes, and is provided with a resistance and all necessary attachments. The use of two arcs diminishes the waste of energy in resistance and shortens the time of exposure. A simple trip control is fitted. (*Messrs. John Bell & Croyden, Ltd., incorporating Arnold and Sons*, 50-52, Wigmore Street, London, W.1.)



* * *

The "Alps" Mercury Vapour Lamp.

The "Alps" quartz mercury-vapour lamp is a simple model, fitted with an adjustable reflector, and tilting gear for striking the arc in the quartz tube. The floor standard type is self-contained, the resistance being mounted on the base, with a control switch and safety fuse. With suitable modifications, this lamp can be used on a.c. as well as on d.c., at any usual voltage. A table model is also made. (*Medical Supply Association, Ltd.*, 167-185, Gray's Inn Road, W.C.1.)

"Alps."

"Grevillite."

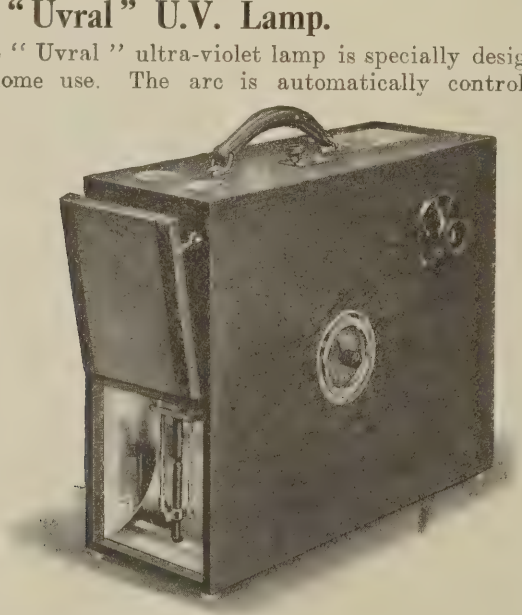
* * *

The "Grevillite" Tungsten Lamp.

The "Grevillite" tungsten arc lamp burns either tungsten or cored carbons, on direct current only; the arc is controlled by hand, and adjustment in all directions is provided. The rheostat is mounted on the stand, with switch and fuse. As here illustrated, the apparatus is fitted with a quartz lens for local irradiation. (*Medical Supply Association, Ltd.*)

The "Schall" U.V. Lamp.

Messrs. Schall & Son, Ltd., make the ultra-violet ray lamp shown in the adjoining figure; the arc lamp is of the hand-feed type, mounted in a bowl reflector on a tripod stand, which is provided with universal adjustments. This lamp is especially suitable for use with tungsten electrodes, taking five amperes, a



separate resistance and switchboard being provided. Automatic-feed lamps are also made. Where the supply current is a.c., special cored carbons are substituted for the tungsten electrodes. (*Schall & Son, Ltd.*, 75, New Cavendish Street, W.1.)

* * *

The "Uvral" U.V. Lamp.

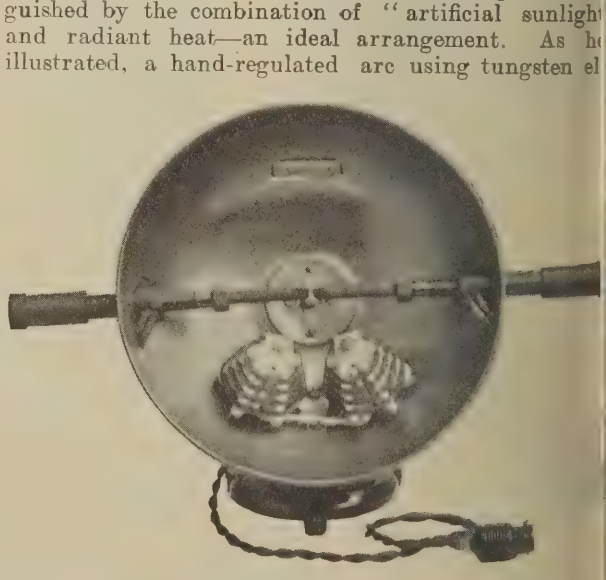
The "Uvral" ultra-violet lamp is specially designed for home use. The arc is automatically controlled,

and burns tungsten electrodes or special cored carbons, consuming from 3.5 to 4.5 amperes; it operates on a.c. or d.c., at any usual voltage. A unique feature is incorporation of a patent time-switch control, "Expometer," which makes it impossible to use apparatus until it has been set for a predetermi dose of from one to fifteen minutes' exposure; at end of the specified time the apparatus is automatic switched off. The whole is contained in a neat t cabinet, and weighs 22 lb. (*Bower Electric* (19 *Ltd.*, 27, Ridinghouse Street, W.1.)

* * *

The "Sunbeam" U.V. Lamp.

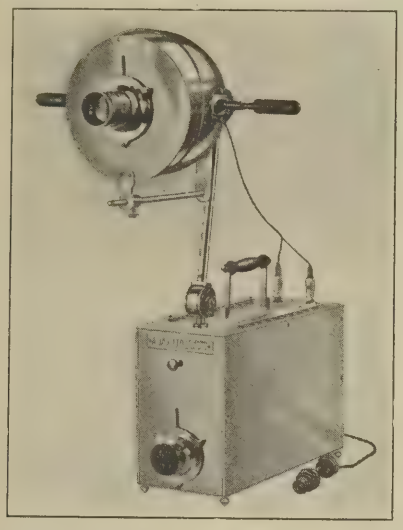
An exceptionally attractive pattern of porta carbon or tungsten arc lamp is the "Sunbeam"; shown, it consists of a light metal case, containing resistance to enable the lamp to be operated on 100 200 volts, and surmounted by a focal reflector wh



can be locked in any position. The arc needs adjustment during an exposure of ordinary duratic special cored and impregnated carbons are used d.c. and a.c., but tungsten electrodes can be used w d.c. (*The Cox-Cavendish Electrical Co.* (1924), *Lt* 105, Great Portland Street, W.1.)

* * *

The "Arc-Radiant" Lamp.



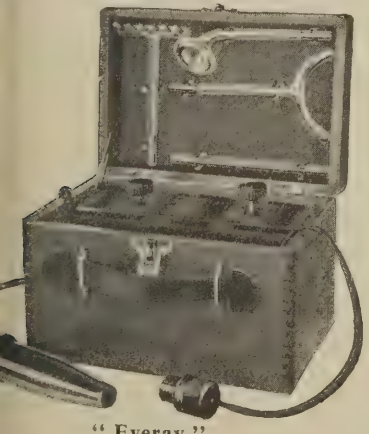
The Quain-Munro "Arc-Radiant" lamp is dist guished by the combination of "artificial sunligh and radiant heat—an ideal arrangement. As h illustrated, a hand-regulated arc using tungsten el

trodes or cored carbons is mounted in a portable bo radiator; the latter can be used for heating alon without the arc if desired. (*Quain Sunlight Lamp Ltd.*, 26, Victoria Street, S.W.1.)

e "Ajax" Tungsten and Carbon Lamp.

The accompanying illustration shows a hand-fed gsten arc lamp (above), and an automatic lamp ning "polymetallic" carbons (below); in the latter carbons are set at right angles, an exceptional angement which, we understand, is highly efficient.

diaphragms and quartz concentrators for local treatt are provided for both lamps, which can also be plied separately. The apparatus is portable (weigh- 14 lb.), and can be used on any lighting circuit. *x, Ltd.*, 117, Central Street, London, E.C.1.)



* * *

2.—High-frequency Treatment.

ck of space compels us to hold over our article upon -frequency apparatus for electromedical treatment. are able, however, to illustrate four examples which ypical of this class of equipment.

"Everay" H.F. Apparatus, Type B.

e "Everay" set which is here illustrated is handly housed in a polished mahogany case, and is ided with a switch covering the usual ly voltages, a.c. or d.c. No metal parts exposed. Three glass electrodes and one llic electrode are clipped into the velvet-

"Everay."

lid, and a carrying handle is provided; the ted handle, adaptor, and flex are packed into a ate compartment. The set weighs 5¾lb. Several patterns are made. (*Messrs. I. Calvete, Ltd.*, 11, St. Andrew Street, W.C.2.)

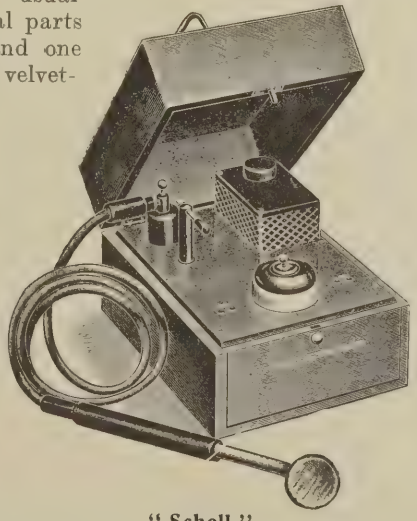
The "Schall" H.F. Apparatus.

A small portable apparatus for d'Arsonval high-frequency currents is here illustrated, weighing 7 lb.; it is suitable for 100 or 200 volts, a.c. or d.c., and includes two electrodes, insulated handle, and flexible connections, the latter being heavily insulated. (*Messrs. Schall & Son, Ltd.*, 75, New Cavendish Street, W.1)

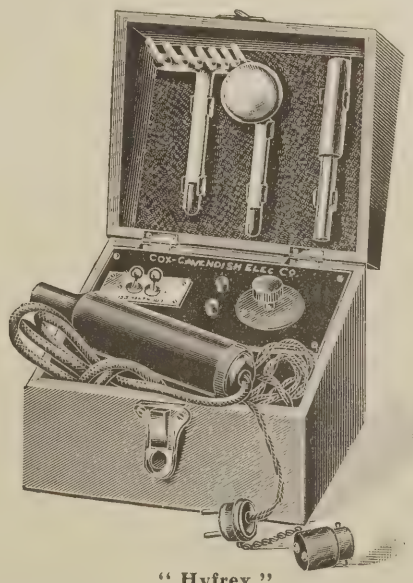
* * *

The Hotpoint "Shelton" H.F. Apparatus

We illustrate herewith a very compact set of high-frequency apparatus, packed in a flat silk-lined case; the whole of the generating equipment is contained in



the cylinder which acts also as the handle into which the applicators are inserted. A set of six applicators is provided, and others can be supplied. (*Hotpoint Electric Appliance Co., Ltd.*, 24, Newman Street, London, W.1.)



* * *

The "Hyfrex" H.F. Apparatus.

The "Hyfrex" instrument for the production of high-frequency currents consists of a polished wood case containing the generator, regulator, and throw-over switches for different voltages, with a compart-

"Schall."

"Hyfrex."

ment to receive the insulated electrode handle, flexible cords, and a combined plug and adaptor fitting. Three electrodes are provided, and are held in clips in the hinged cover. (*The Cox-Cavendish Electrical Co.* (1924), *Ltd.*, 105, Great Portland Street, W.1.)

Selling Lines for Retailers.

Probably one of the advantages of electrical domestic apparatus which has a big appeal to the housewife is its portability. Of particular interest in this connection is an electric iron and travelling outfit which has recently been put on the market. This consists of an electric iron, which is suitable for use on any voltage, complete with a suitable nickel-plated stand, a special water boiler, and a curling-tong heater, the whole being contained in a neat plush-lined wooden box. This is one item of a range of domestic equipment made by the General Electric Co., Ltd., Magnet House, Kingsway, W.C.2, which is described and illustrated in an interesting and useful pamphlet, "Magnet Household Electrical Appliances." A feature of this publication is that while the necessary technical information required by the retailer is brought out, such as the loading of the apparatus and the pressure for which it is designed, an effort is made to get on the understanding level of the prospective purchaser or user regarding the cost of running the equipment. An approximate cost for a definite performance is given; for instance, an electric toaster which is suitable for operation on the breakfast or tea table is described as being capable of toasting between 60 and 70 slices of bread for one penny. Two items of perhaps unusual interest are an electric egg whisk and a drink mixer. Fig. 1 shows the former. In each case a small electric motor is mounted vertically on the top of the mixing apparatus. Various cooking apparatus is listed, from the small hot plate for table use to the complete cooking stove for a family of eight persons. One of the difficult problems nowadays for the occupier of the small flat or house, is to find a suitable appliance for the very limited space available. The electric griller shown in fig. 2 is the result of an attempt to meet the demand for such an apparatus. It will provide for frying, grilling, boiling, and toasting operations, and also serve as a hotplate. A meal for one or two people can be cooked rapidly and efficiently; a steak can be grilled for about one penny where the rate is 1d. per kWh.

Increased attention is being given to-day to the question of installing refrigerators in the home, and here, again, electricity is proving itself to be the most suitable medium for the operation of such apparatus. A refrigerator offered by this company provides 18.5 cu. ft. of storing space, although the overall dimensions are only 6 ft. 6 in. by 3 ft. by 2 ft. 9 in. The apparatus is safe, simple, and reliable, and its upkeep costs are very small.

* * *

The use of the domestic electric vacuum or suction cleaner has of recent years increased enormously, and manufacturers are giving the subject very close attention. The company dealing with this appliance is Standard Telephones & Cables, Ltd., Connaught House, Aldwych, W.C.2, which treats of the value of the electric cleaner in the home in a well-produced and illustrated booklet, "The Home of Leisure." Fig. 4 shows the vacuum sweeper produced by the company, which, as will be seen, is of the bag-container type. Attention is drawn to the ease with which dirt and grit may be removed from almost inaccessible places, such as between the cushions and the padded sides of an arm-chair. Included in the accessories provided with this apparatus is what is per novel in this country, the "Vac Mop." means of this crumbs and dust can be removed the kitchen linoleum without the slightest risk of dar to polished surrounding walls and furniture. L of beautiful table furniture and decorations wil very interested in a dozen or so of electric table a ances which are illustrated in a small folder, "T Appliances of Distinctive Quality." The range cludes coffee percolator sets, coffee urns, a tea-pot, k and toasters, all electric, of course, of ornamental signs and finished in silver, aluminium, or nic plating.

The electric washing machine has been a much lected apparatus in this country, although its ad tages to all concerned are obvious. Fig. 7 shows a machine, which is obtainable from the above compa and by means of which, it is claimed, the average fa wash can be done at a cost of only 1½d. for electric a negligible amount when the great saving in time energy is considered. The apparatus is in the form a cabinet and includes a wringer which is driven by same motor as the washer. The motor and mechan are constructed so as to require very little atten and are very easily controlled.

As a companion to the above machine, the comp produces an ironer which, while useful in the ho should find an easier market in hotels, institutions, The effective parts of this are a roller and an e trically-heated shoe. The roller is 30 in. long and 6 in diameter; it is well padded and runs on ball be ings. The shoe has an area of contact of 147 sq. and the energy consumption of this and the driv motor is in the neighbourhood of 1,200 W.

* * *

Among the new lines which are available to the c tractor and retailer is the "Volta" vacuum clean which has only been on the British market for a v few weeks. There is a growing preference for the t of cleaner in which the dust bag or box is separate fr the nozzle portion, that is, connected only by a flexi hose. Such is the "Volta," as will be seen from our ill tration (fig. 5). The suction of the machine, which is p vided by a small motor in the rear compartment of body of the machine, is excellent. We recently w nessed a demonstration in which a ⅞-in. diameter st ball was picked up and hurried away to the dust b The latter occupies about half of the body, and is tained in position by the front cap, which is held tigh by two spring catches. A feature of the machine is absolutely flat end enabling it to be stood vertically the removal and replacement of the bag. A compl set of useful accessories is provided, including a sh nozzle, a nozzle mounted on about four feet of rigid tu a large wide brush and a small round one. Thus, ap from use upon the floor, the machine can be employ for cleaning all parts of a room—even the picture rail and the long-arm nozzle can be pushed under very l furniture. The cleaner is being handled by Vol Ltd., Kern House, Kingsway, W.C.2; Mr. J. Scriven who has had many years' experience of the vacu cleaner business, is managing director of the compar Volta, Ltd., deals exclusively with the trade; no sa are made direct to the public.

1.—A "Magnet" Egg Whisk.

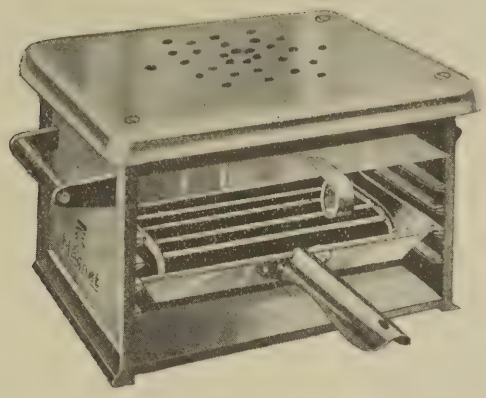


Fig. 2.—A "Magnet" Grill.

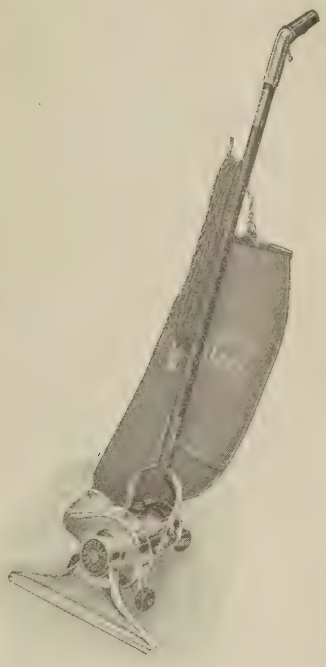
Fig. 3.—An Immersion Heater.

4.—The "Standard" Vacuum Cleaner.

Fig. 5.—The "Volta" Vacuum Cleaner.



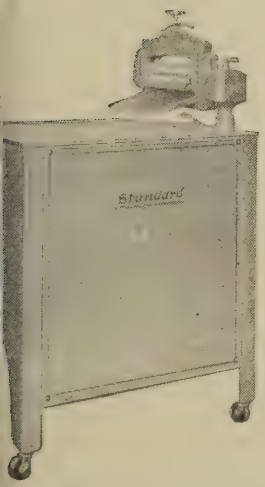


Fig. 6.—The "Cadillac" Vacuum Cleaner.

7.—The "Standard" Washing Machine.

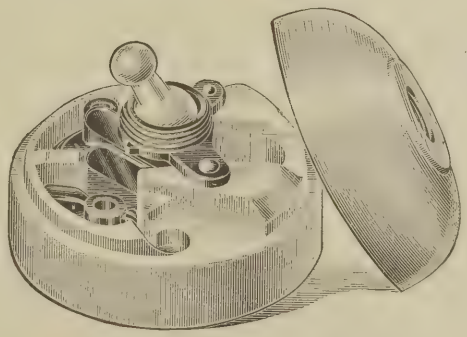

Fig. 8.—An "Efesca" Switch.

Fig. 9.—The "Turnover" Toaster.

Fig. 10.—The "Sunray" Torch.

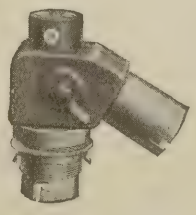

Fig. 11.—A Two-way Adaptor.

In addition to wiring supplies and domestic apparatus, Messrs. Ward & Goldstone, Ltd., Frederick Road, Pendleton, Manchester, make many small novelties which are likely to attract customers to the retailer's shop and perhaps lead up to more important business. There is always a demand for pocket lamps from people who are not at the moment interested in larger electrical applications, and it is well for the retailer to attract these if he can. Messrs. Ward and Goldstone supply a wide range of such lamps; one of them, the "Sunray," a "fountain pen" torch, is illustrated in fig. 10. To deal next with the man who at present uses electricity for lighting only: it is a very difficult matter to sell him a cooker right away (quite apart from the necessity for extra wiring), and it is not always simple to induce him to buy a toaster or kettle. It should be far easier to introduce him to an immersion heater, which is inexpensive, a lampholder device, and very adaptable for a number of uses. The "Goltone" immersion heater depicted in fig. 3 is a typical example of this kind of appliance. It is provided with 5 ft. of flex and a lampholder adaptor, or, at a slightly higher cost, with a two-pin plug.

Messrs. Ward & Goldstone's Booklet N.50 contains illustrated details of these and numerous other small devices which should interest the retailer.

Messrs. Falk, Stadelmann & Co., Ltd., ringdon Road, E.C.1, are well known as viders of wiring materials of all kinds, as as a variety of lighting, domestic and radio ap ances. Among their recent productions is a tum switch designed to conform to Home Office requirem in the matter of insulation. For this purpose the c pany has commenced the manufacture of "Duroid," unbreakable, insulating and non-inflammable comp tion for tumbler-switch covers. The threaded m centre is retained in the design of the switch, but i effectively shut in by a flange in the cover. The c position is applied to both the "Efesca Snap" qui make-and-break switch and the ordinary "Efesc slow-make type. One point in both these patterns i special leaved contact. One of these switches is ill trated in fig. 8.

The latest publications of Messrs. Falk, Stadelma include a little booklet (Catalogue No. 546), contain illustrations and prices of "Ideal" domestic ap ances, including irons, water heaters, grills, toaste kettles, and percolators. The main value of the book lies in the very explicit instructions which are giv for the use of each appliance.

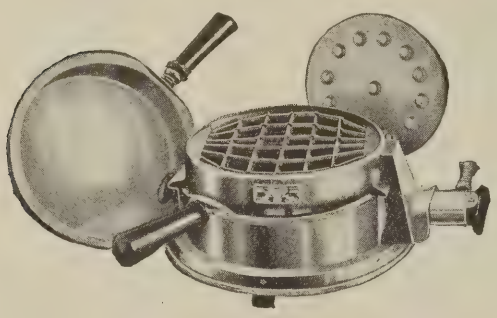

Fig. 12.—The "Utility" Table Cooker.

Fig. 13.—A "Fulray" Bowl Fire.

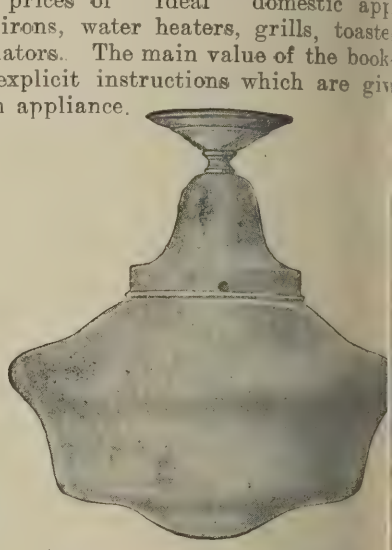

Fig. 14.—A "Silvaray" Fitting.

"Cosmos" appliances (Metro-Vick Supplies, Ltd., Trafford Park, Manchester) have benefited from the publicity accorded to "Cosmos" lamps and valves, and their name should have a familiar ring to the public. From such a large selection it is difficult to choose examples which will typify the whole. The "Turnover" toaster is a neat appliance which should commend itself to the electrical buyer. It is safe and convenient; the bread is turned over by simply twisting an insulated knob which is seen in the accompanying illustration, fig. 9. It has the ample loading of 550 watts. The "Cadillac" electric suction cleaner is a machine of handsome appearance and reasonable price, and in view of the approach of spring and its orgies of cleaning, is a seasonable article for display. The "Cadillac" weighs 12 lb., and is provided with 20 ft. of flexible cable. It is shown in fig. 6.

While the use of the lampholder for heavy current consuming devices should be frowned upon by the retailer, there are many small domestic appliances which can conveniently be connected to the mains in this way. This is easy in daylight, but troublesome when both the light and the appliance are wanted simultaneously. In such circumstances a device similar to the "Utility" adaptor illustrated in fig. 11 is undoubtedly useful. This particular Metro-Vick "gadget" has a small switch incorporated in it to enable the lamp to be switched off if desired.

Some mention should be made of lamps. One of t latest catalogues received deals with "Siemens lamps, which are typical of those made by members of the E.L.M.A. While clear-glass lam have still by far the largest sale, there is growing appreciation of diffusing bulbs and eve coloured ones for home lighting. "Silvalux" lam have a double glass bulb, the inner lining being of cle glass and the outer portion of opal glass. A somewh similar effect is obtained by "Purlite" lamps, but the are internally frosted. The colour-spraying process applied to both vacuum and gasfilled lamps, and t following colours are obtainable: red, blue, gree yellow, amber, ivory and flame. The Siemens an English Electric Lamp Co., Ltd., 38-39, Upper Tham Street, E.C.4, also produces beautiful lightin fittings; the one shown in fig. 14 is typic of the company's "Silvaray" glassware fittings. A other large section of the company's business is tha devoted to domestic appliances. The "Siemens-Xcel range includes fires, cookers, irons, kettles, toaster &c. Of the heating apparatus, the small bowl fire (th "Fulray") illustrated in fig 13 is likely to appeal t the public as being convenient for general purpose Another all-round "Siemens-Xcel" appliance (we refe to its qualities not its shape) is the "Utility" tabl cooker shown in fig. 12. It is claimed by the makers t be the only British made article of its kind.

THE

"ELECTRICAL REVIEW"

COMPETITION.

THE advertising competition was judged at the Hotel Cecil, on Thursday Morning, 17th February, 1927.

The Judges on this occasion were:

Mr. J. W. BEAUCHAMP, M.I.E.E., of the E.D.A;

Mr. W. F. T. PINKNEY, M.I.E.E., of the Newcastle-upon-Tyne Electric Supply Co., Ltd;

Mr. H. T. YOUNG, of Messrs. Troughton & Young, Electrical Contractors, Knightsbridge, London,

RESULTS.

FULL PAGE CLASS I.

(Generators, Motors, Turbines, Engines, Condensers, Compressors, Coolers, Heavy Switchgear, Batteries [Storage] and Heavy Machinery in General.)

£50 - The British Thomson-Houston Co., Ltd., Rugby. Advertisements prepared by Mr. A. L. M. AYERS.

FULL PAGE CLASS II.

(Fittings, Switches, Lamps, Valves, Insulators, Fans, Tools, Bearings, Heating and Cooking Apparatus and General Electric Accessories.)

£50 - The Ormond Engineering Co., Ltd.
Advertisements prepared by Messrs. BERTRAM DAY & CO., LTD.

A SPECIAL AWARD WAS GIVEN IN THIS CLASS TO

£25 - W. T. Henley's Telegraph Works Co., Ltd.
Advertisements prepared by Mr. JOHN S. SIMMONS.

FULL PAGE CLASS III.

(Instruments, Meters, Telephones, Wires and Cables, Conduit Wiring Systems, Radio Sets and Components, and Apparatus not covered by Classes I. and II.)

£50 - Stella Conduit Co., Ltd.
Advertisements prepared by Messrs. H. P. POPE, LTD., Birmingham.

HALF-PAGES.

As there were insufficient Entries in each of the Three Classes, they were all judged in one Class.

£25 - Varley Magnet Co. Advertisements prepared by E. WALTER GEORGE, LTD.

A SPECIAL AWARD WAS GIVEN TO

£15 - Midland Electric Manufacturing Co., Ltd.
Advertisements prepared by Mr. JOHN F. PRESTON, Birmingham.

On the following pages we give the Report of the Judges, and reproduce the successful Advertisements.

The Judges' Report.

IN the second Competition promoted by the ELECTRICAL REVIEW to stimulate interest in Advertising technique within the Electrical Industry, there were submitted 22 sets of six full-page displays and eight sets of half-page displays, the latter covering all classes of material advertised in the REVIEW, whilst the former or full-page series was divided into three classes: plant and machinery, accessories and appliances, material and sundries.

The general standard of the advertisements submitted was distinctly high with regard to all the leading requirements of publicity display of this class and for such a journal; in many cases, however, the treatment lacked uniformity in value throughout the whole of the displays offered; most of the sets presented one or more examples much to be commended and above the average or the worst of the set.

In judging modern technical advertising, one must consider the varying difficulty which confronts the advertiser or his expert according to the character of the material for which publicity is required. In some cases the magnitude of the article or its final environment assists the advertiser, and lends impressiveness to the display. In this respect some of the advertisers have already the advantages enjoyed by the transport companies, who are assisted in their modern advertising by the support of striking scenery or buildings with historical association.

Incidentally, advertising of this class has a prestige value for electrical service as a whole, in addition to its main object —selling the advertised material, or maintaining the reputation of the maker. It is important, however, that the imagination of the designer should not be too much occupied by the fortunate adjuncts of his task. Some of the examples expressed a nice balance between the dramatic significance of the material illustrated and the selling value of brief, if rather technical, information about its leading characteristics and correct method of use; others rather missed the opportunity of conveying some information about the product which would give point to the impression created by the illustration.

Advertisements of this class, apart from any particular information in diagram, graph or letterpress form, can be effective when merely constituting a record of good work done, but where that alone is relied upon the advertising needs to be frequent, extensive and varied, whereas the presentation by the manufacturer of some particular, if small, selling point or virtue in the appliance, can often best be advertised by the continuous repetition of some well-thought-out display.

Many examples can still be seen in the technical Press of to-day where machinery and appliances, sometimes even material of outstanding value, are advertised with little or no imaginative support. On the other hand, some very fine modern advertising appears to fail by the imaginative support being overdone when, if it does not completely overshadow the main issue in the reader's mind, it at least divides his attention, placing in his mind two distinct impressions where it should leave but one and that one riveted the more firmly by a not too strong supporting suggestion relating to the use of the material or to the advantages which its use brings either to the retailer of it or to the ultimate consumer.

It is very necessary in technical advertising that the people responsible for material, and familiar with its particular and technical appeal to the buyer, should work closely with those who may have been brought on to the scene because of their knowledge of advertising practice and ability to visualise an attractive treatment which might not occur to the more technical mind. This co-operation is needed to prevent the overshadowing above referred to, and particularly to avoid foolish technical errors which may otherwise creep into the letterpress and illustrations.

In advertising accessories, particularly perhaps those bought by retailers as part of their raw material and only finally bought by the user as a component in his finished installation, many points of real advertising interest arise: the quality and durability of the appliance; its price, appearance, and the influence which its use may have on the cost of erection or ultimate permanence of the installation; features connected with ease of wiring and fixing, reducing the call upon the skill or care of the workmen installing the appliance, or using it afterwards; foolproofness, &c.

In some of the advertisements in this competition the mo has been made of these points, and simple appliances hav been advertised strongly on some feature of construction i a clear manner, with generous spacing and calculated to appe to the practical man with little need to refer to the letterpres

In our trade papers it is desirable not to miss any technic "story" opportunity if it can be made clear at a glanc and not to rely exclusively upon a well-known name, a drama tic treatment or catchy headlines; all these can be valuab in the first test of an advertisement—"power to arrest atte tion," and to some extent the second—"power of retainin attention"; but they may fail through not giving some cle message of sufficient interest to remain in the reader's min There is a good deal of magic in names and short descriptiv Trade Words. Some of these have already grown into th language, but they generally have some happy accident abou them, some distinctive sound or rhythm, which remain readily in the mind. The number of such words which ca be found is necessarily limited, and attempts to produce Trad Names are not always successful. Combinations of initia letters or contractions of longer words require to be con sidered with care before being generally adopted; example can be found where a well-known name has been submerge in favour of an invented word with no greater merit, an requiring fresh mental effort by the reader.

Some of the really fine examples of imaginative supportin treatment and designs suffer from the serious fault that although striking, they are not related to the main subject, an rather suggest that the expert has become too muc enamoured of his own bright idea.

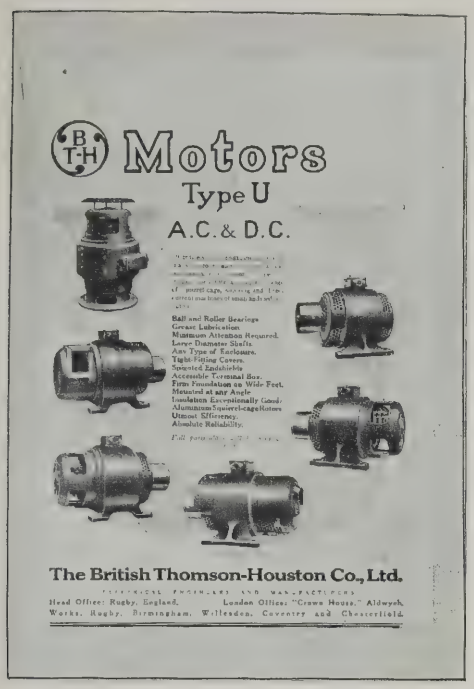
The ingenuity of the advertiser is rather taxed when makin a display on behalf of material which has been a commonplac in the business for years. It may not be of distinctive appear ance, nor can it even be put forward as having the virtue o invisibility in use; here refuge is often taken in an appea which illustrates the place or use behind which the advertise material is performing some function. A good advertisement can in such cases often be produced by inverting the procedure adopted with striking appliances or plant, allowing the sup porting design or idea to make the main picture, and being itself supported by some illustrative treatment of the actua material offered.

The plainest and simplest material can with a little thought be illustrated in a way which is impressive or, as one may say, harsh, so making a definite impression on the mind.

It seems desirable on behalf of the advertisers who pay, and the skilled people who draft, to enter a reminder that some material does present considerable difficulty in treatment. In such cases the expert starts handicapped and needs to give thought to the subject, and even then, perhaps, must rely to a large extent on inspiration or bright ideas, of which there may be no lack, but which are difficult to command just when wanted.

Generally the letterpress used in the advertisements reviewed was of high standard and employed with restraint. Efforts to arrest attention by playing tricks with type and letter arrangement are seldom successful; they cannot redeem bad copy, and they only distract attention from goods.

There were still some instances of false economy in using blocks of poor quality or much the worse for wear. In advertisements and catalogues the electrical trade is often too economical in this respect, as well as in using inferior photographs in the first instance.



The writers of this Report would like to put on record their thanks to the ELECTRICAL REVIEW for the facilities offered for judging in this interesting competition. The task, not a light one, and lasting for a considerable time, was a liberal education in itself and much assisted by the method of classifying, mounting, and exhibiting the advertisements which the organisers of this competition had adopted.

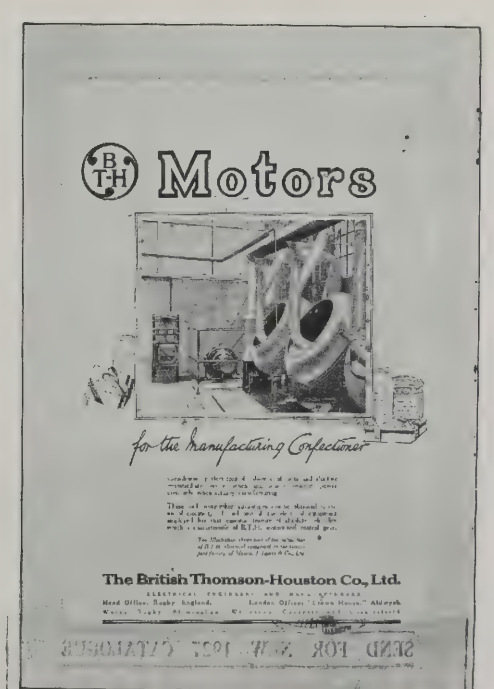
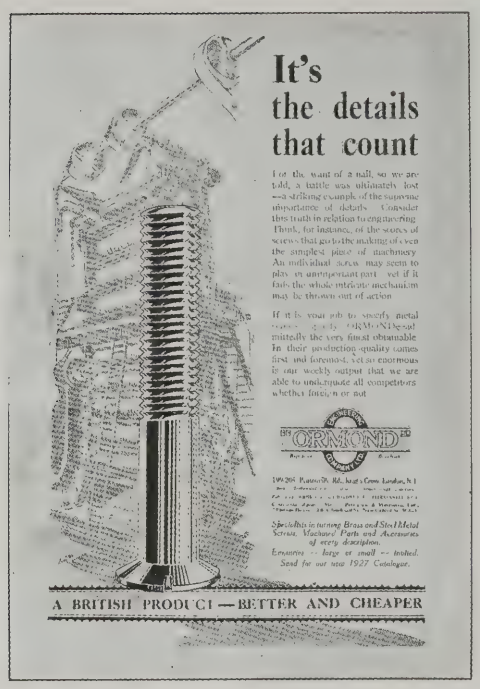
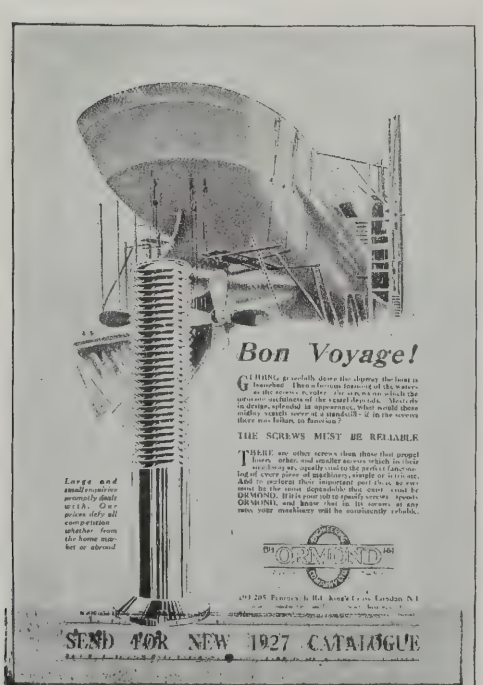
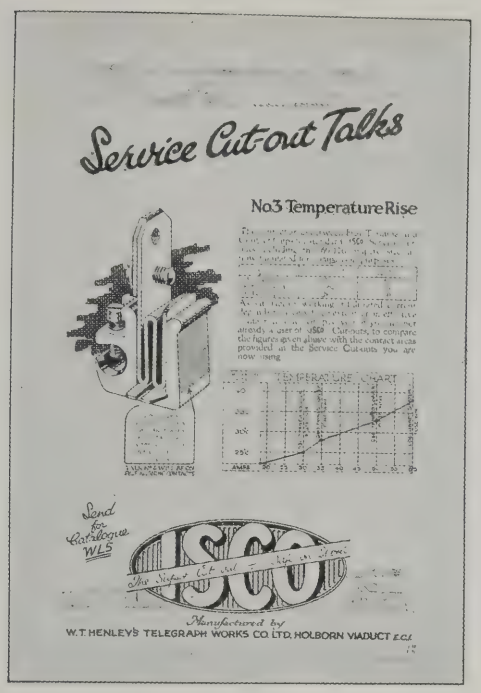
CLASS I (FULL PAGE) WINNING DESIGNS.

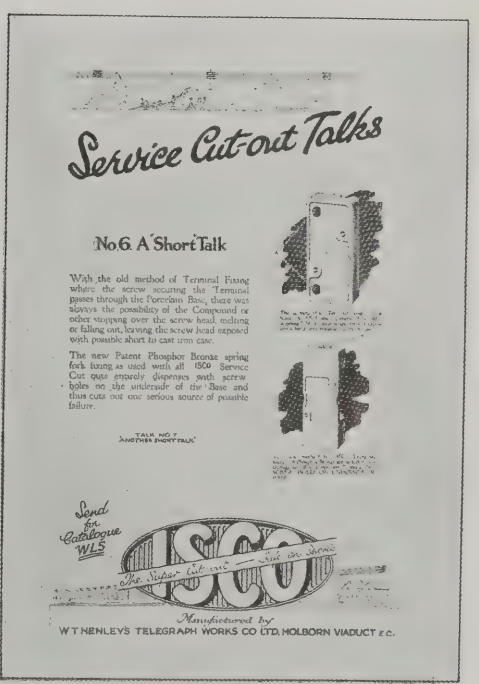


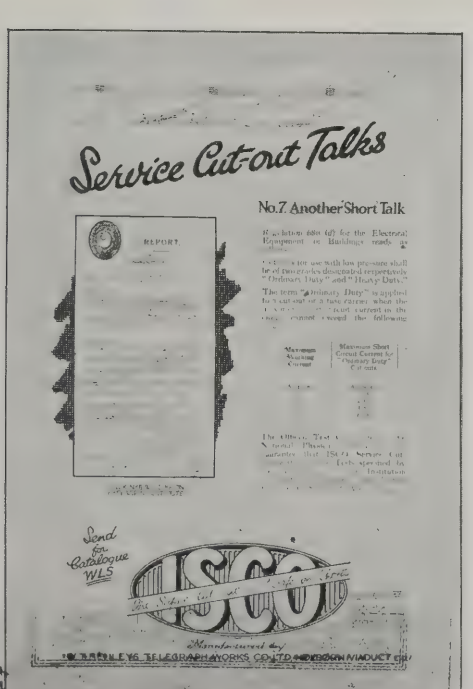




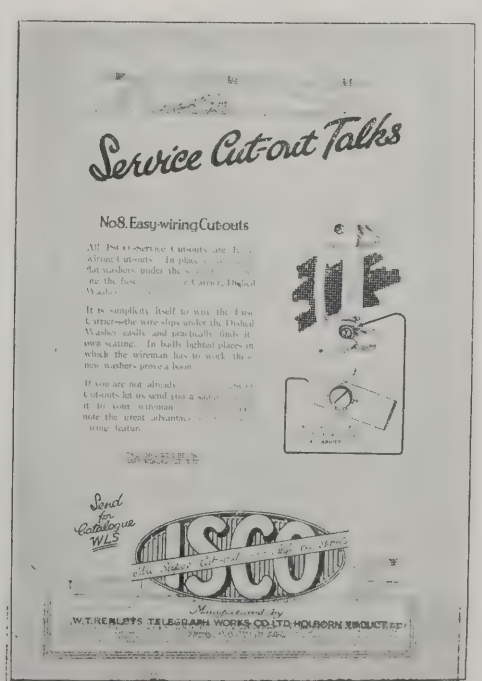
CLASS II (FULL PAGE) WINNING DESIGNS.







CLASS II (FULL PAGE) SPECIAL AWARD DESIGNS.



CLASS III (FULL PAGE) WINNING DESIGNS.

STELLA·CONDUIT

STELLA

QUALITY AND SERVICE

IN the wiring of individual houses, Model Villages, Garden Suburbs and housing schemes generally, a considerable amount of Stella Conduit is used. Architects appreciate the fact that Stella Conduit does not interfere with existing schemes of decoration. Contractors and Engineers know from experience of its sound construction and lasting serviceability. All round it is regarded as eminently suitable for this class of work.

STELLA·CONDUIT

STELLA

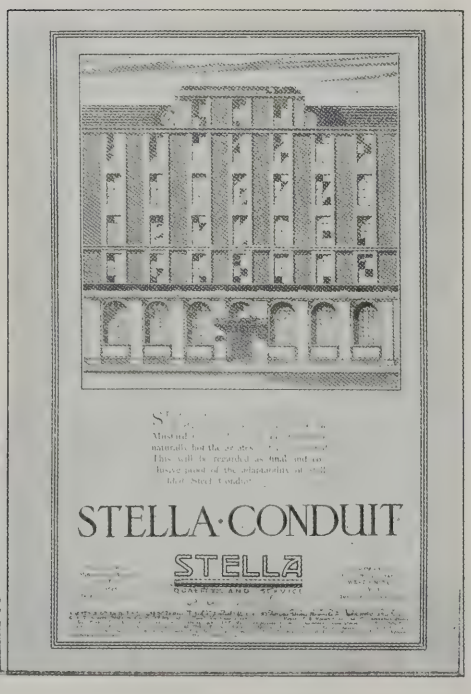
QUALITY AND SERVICE

IN Churches and such like buildings most parts ularly the wiring system must be unobtrusive. For this reason and in consideration of other such qualities as price and genuine excellence, Stella Conduit is very widely used. It is the first choice of many Architects and Electrical Contractors.

STELLA·CONDUIT

STELLA

QUALITY AND SERVICE



STELLA Conduit has been employed in the wiring of very many country residences. In whatever part of the country a client may live, he has to be carefully considered, Stella Conduit affords excellent and reliable protection. And such protection is not at the expense of lightness. Stella Conduit can be arranged to harmonise with all architectural schemes.

STELLA·CONDUIT

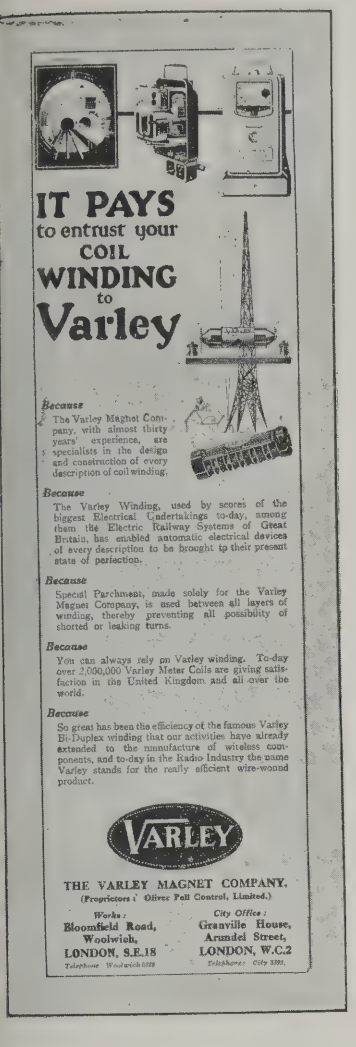
STELLA

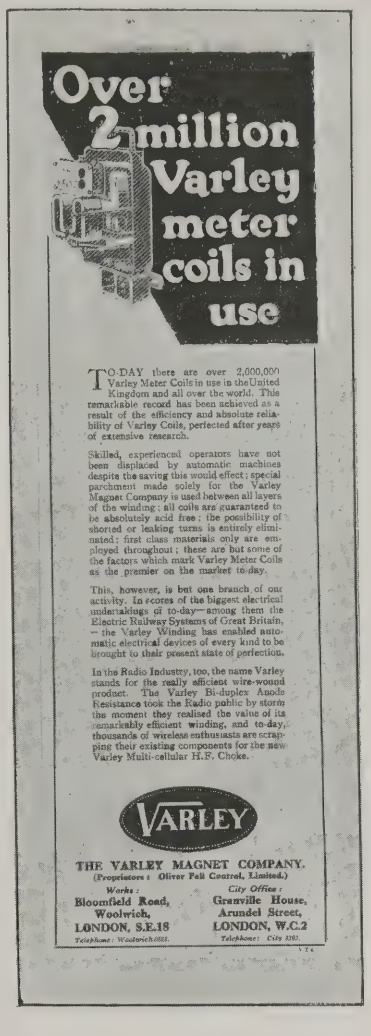
QUALITY AND SERVICE

STELLA·CONDUIT

STELLA

QUALITY AND SERVICE





FOR Factories, Warehouses, Offices, etc., "Stella" Conduit is essentially the best that can be used and is to-day in demand throughout the country. Contractors and Engineers know from experience its quality, dependability and soundness of construction. More suitable material for all classes of work is unobtainable.

GOES ROUND M.E.M. THE WORLD

M·E·M

M.E.M. in India.

On the Indian Railways, and by all the large Industrial organisations M.E.M. is used. It is appreciated as the best Gear obtainable, and its performance at all times confirms this. Stocks are carried by all electrical supply houses.

The M.E.M. range of Ironclad Gear comprises—The "GLASGOW-REX" Switch; the "MEMREX" and "MEMETTE" combined Switches and Fuses; the "KANTARK" Fuseboard. They are fully described and illustrated in publications Nos. 150, 155, 156 and 157. Any, or all, sent free on request.

Notes and Comments.

Coming Events.

During the next few weeks several conferences of some importance to the electrical industry will be held, principal amongst which are the Summer Meeting of the Institution of Electrical Engineers, the Annual Conference of the Electrical Contractors' Association Allied Associations, and the Annual Convention of the Incorporated Municipal Electrical Association. Although, of course, there will not be a great amount of effort devoted to the interests pure and simple of the electrical retailer, we feel sure that the retailer will be interested in the proceedings, and consequently a brief outline of these may not come amiss.

The annual convention of the Incorporated Municipal Electrical Association will be held at Buxton from May 30th to June 4th. It will be formally opened by the Mayor of Buxton on May 31st, on which date Mr. R. W. L. Phillips, M.I.E.E., will read his presidential address. The remainder of the period will be devoted to the reading of papers and discussions thereon, and visits, not the least important of which will be to the exhibition of electrical apparatus, which each year grows in importance.

The summer meeting of the I.E.E., which will be held from June 14th to 17th at Newcastle-upon-Tyne, is more of a social than a business event. A number of visits will be paid to various works in the district, including turbine and switchgear manufacturing concerns, and also to shipbuilding yards and coal mines. The social functions include a civic reception and a reception and dance at Armstrong College.

The annual conference of the E.C.A. Allied Associations is to be held at Scarborough from June 22nd to 25th inclusive, and some particulars of this appeared in our last issue. The most notable events will be the presidential address of Mr. H. J. Miles, several interesting papers and discussions, a short address by the new president, Mr. W. A. Shaw, of Stockport, and the annual general meeting, which will be held on June 23rd.

* * *

The Central Scotland Electricity Scheme.

One of the most pleasing events of the past month in the electrical industry has been the publication of the Central Scotland Electricity Scheme, 1927, which the Electricity Commissioners have prepared and submitted to the Central Electricity Board. This scheme, with the full particulars of which we are not concerned here, deals with an area of 4,980 square miles, including roughly the whole of the industrial, shipbuilding, and coalfield areas of Scotland. It looks forward to the area being supplied in ten years' time by eight capital stations, which will be interconnected by a series of high-pressure main transmission lines. The transmission system is designed to form a series of ring mains, so that there will be alternative routes to points of supply, and consequently greater security against breakdown.

TRADE NOTES AND NEWS.

The scheme, of course, has been generally anticipated, but it is very cheering, and highly hopeful for the future, to note that the Central Electricity Board are not "letting the grass grow under their feet," and are quickly settling down to their task. The scheme is a big one, involving a huge sum of money and a tremendous amount of work, but we have every confidence that the responsible authorities will carry it through to a successful conclusion, the benefits of which are fairly obvious. Other schemes in course of preparation deal with Central England; Yorkshire, Lancashire and Cumberland; South-East England, including London and the Home Counties; South-West England; and South Wales, and it will be interesting to see whether the Commissioners and the Central Electricity Board will act as expeditiously as they have in the present case.

* * *

The Electrical Contractors' Association.

In our March issue, it will be remembered, we published a message to the trade from Mr. H. J. Miles, president of the Electrical Contractors' Association, Incorporated, in which he outlined the benefits membership of that Association had to offer. During the past week or two this information has been considerably augmented by a brochure issued by the Association, which can be obtained on application to 15, Savoy Street, Strand, W.C.2. This brochure outlines in a lucid manner the development of the Association, its present status, and in what manner it helps the electrical contractor in his work; it also deals with the allied associations: the N.E.C.T.A., Limited, and the National Federated Electrical Association.

Of particular interest is the fact that the E.C.A. has a section specially for electrical retailers, who are entitled to all the advantages that membership affords. Since this is, at any rate at present, the only organisation working on behalf of the electrical retailer, it is surely deserving of the support of this section of the industry. No one would deny that in the electrical development of this country the retailers will play an increasingly important part and that consequently they should work on an organised basis, such as an efficient trade association secures. Many problems have to be decided, such as price maintenance, price-cutting, "dabbling," discounts, and so on, and unless there is some recognised association representing the electrical retailers there can be little or no unanimity on these points. The ancient fallacy that the lone hand is best, that trade associations and trade unions are things to be avoided, has long been exposed, and unity is now the order of the day. The electrical manufacturers have their association, the electrical wholesalers theirs, and it can only be to the good of the industry that the electrical retailers also combine for the voicing of their opinions, for maintaining their true trade status, and for their own betterment generally.

* * *

The Right Attitude towards Complaints.

A factor that is almost inseparable from electrical retailing is the complaint. To avoid this is a wrong policy, for, trivial as the grounds for complaint may be, the customer making it is entitled to a hearing, and he will form a higher opinion of the retailer if and when a complaint has been settled to his satisfaction. This comes from the insight received into the dealer's side of the question, and the pains taken by the latter to trace the trouble, if any, to its source. In the matter of lamps, it has happened in the past that a customer who has some real trouble tries to strengthen the case by returning all the old lamps used, including some which have obviously had a good life. Care must then be taken to discriminate between normal failures and genuine "troubles." The person making a complaint may say something which gives a clue to the cause of the trouble, and so it is advisable for the dealer, even after first examination of the lamps, to say as little as possible himself until the full facts have been obtained. No complaint, whether it concerns lamps or other goods, should be treated lightly. The ideal to aim at is to turn every complaint into a purchase and to leave the complaining party eminently satisfied.

* * *

Necessary Knowledge.

The trader who enters into electrical retailing with little or no knowledge of electricity or of the goods he proposes to sell is running a very grave risk, a risk only a few degrees less than that run by the electrical expert who enters electrical retailing with only a vague idea of selling methods. The electrical retailer, in short, should not only have a rather more than working knowledge of electrical matters, but he should also be versed in the intricacies of retail selling. The one is a necessary complement of the other, and, speaking generally, it may be said that one is of little value by itself.

There are, however, several other points of some importance to be taken into consideration, most of them of a local character. Of these, the most important is the local electricity supply. The retailer ignorant on this point who attempts to sell electrical apparatus may be compared with the street hawker who tries to sell mechanical toys without knowing how they work. Guesswork will play a large part in any sales, and because of this many customers will be lost. The electrical retailer, therefore, must be thoroughly conversant with all details of the local electricity supply, such as voltage, periodicity, price, and so on, and he must also give careful attention to any changes that may take place. In this respect, any such changes are always reported in the Electrical Review, and there can be no excuse for ignorance on these points. But, in addition to this, the electrical retailer must be able to say in a moment what will be the running costs of a particular appliance. Running costs have a direct bearing on the purchase price, and both must be given to any prospective customer if deception—innocent though it may be—is to be avoided. The customer, too, will appreciate this information, and in this manner a new customer can easily be turned into a permanent and satisfied client. A little trouble taken in this direction will surely add greatly to the goodwill of the business, and every electrical retailer should make it a duty to see that he and his assistants are armed with this knowledge.

* * *

Indirect Salesmanship.

One of the finest forms of advertising that any retailer can have is the spoken recommendation of a satisfied customer. This form of indirect publicity can usually be productive of more sales than the most elaborate newspaper advertising, especially in the smaller communities, where most of the inhabitants are known to each other. This, of course, is well known to experienced retailers, but there are, nevertheless, many

retailers who regard a sale merely as the exchange of goods for money, and content themselves with treating it in that light, utterly disregarding the potentialities of the customer.

Not every retailer, however, appreciates another form of indirect publicity of almost equal value: the recommendation of the influential residents in the locality. Of these, the most important are the doctor and the parson, the former being the most promising agent from the electrical retailer's viewpoint. The doctor plays a leading part in the life of his community, being interested in preserving the health and well-being of those around him, and his word undoubtedly carries great weight in the homes which he enters either professionally or socially.

The electrical retailer should demonstrate to the doctors in his locality just what electricity can do to lighten labour and preserve the health of the community generally. The doctor should be shown how the electric washing machine eliminates the ailments due to too much unhealthy bending and strain on the back; how the electric refrigerator safeguards food during hot weather; how the electric iron lessens the housewife's labour; and how each of the other electrical domestic appliances has its own story to tell of health preservation, not excluding the purer air which results from the use of an electric fire. The arrangements for the demonstration must differ with varying circumstances. But the electrical retailer who takes pride in his work must surely give it sooner or later. Undoubtedly the doctor can be one of the best and most effective mediums for electrical propaganda, and the retailer should not hesitate to enlist his services.

* * *

A Better Business Bureau.

Speaking at a luncheon of the Incorporated Association of Retail Distributors recently, Mr. Louis E. Kirstein, a noted American business man, outlined the functions of the "National Better Business Bureau," a business society that has a large following in the land of dollars. The Better Business Bureau, it seems, is a movement for promoting fellowship amongst those engaged in industry, finance, and retail trading, and also to see that its members do not stray from the path of honest trading. It attempts to carry out the precepts of "truth in advertising," and if any of its members exceeds the bounds of truth, or even if non-members fail in this respect, strong steps are taken to put the matter right. In other words, the Bureau teaches its members to "play the game," and in this manner increase their business in a legitimate manner.

It seems to us that a trade society run on similar lines would be of genuine value in this country, for, frankly, much of the advertising that one sees to-day is by no means based on the maxim "fair play is a jewel, and truth a casket of jewels."

Truth in advertising may sound a bit cold to many, and it may seem difficult to write advertisement copy without making use of a number of laudatory adjectives which are apt to deceive, but both these policies are best in the long run. The public appreciates being told the whole truth and is not, as a rule, slow to express its appreciation in tangible form.

* * *

Why Customers Do Not Return.

It is the steady customer who enables the retailer to place his business on an established basis. The occasional customer who makes a purchase and then never returns to the shop, although adding to your net sales, is not helping to build up your trade on a sound foundation, as is the customer who always comes to you for his electrical requirements. These are your best customers, and it is to obtain and maintain these that the sales staff should direct its efforts. If you find that casual customers are not returning to your shop, you should make every effort to discover why, and particularly whether it is due to any fault of your own. Possibly a customer, urged by disappointment or vexation, perhaps because one of the sales staff has erred, may be the means of dissuading other people from coming to your shop. You owe it to yourself and to your business to find out why every customer does not follow up a first purchase.

When such a procedure is adopted, you may be sometimes surprised at the results. You may discover, through tactful probing, that one customer is discontented because a purchase has been forced upon him by an over-zealous salesman, or that a former patron discontinued further purchases because the articles failed to give satisfaction. It is valuable to find these out, because in the future you will be impelled to fight shy of the salesman who tries to palm off questionable goods. You may learn to your regret, but to your advantage, that a certain sales assistant in your shop is not giving satisfactory service. The successful retailer is the one who is giving his customers the best service; he is the one who is encouraging his patrons to come again, to buy again, to keep the business running—which is the course pursued by every progressive retailer to-day. People are naturally disposed to favour the shop that makes an effort to please them.

* * *

Shop Windows and Advertising.

In connection with the two words "sales production," there are two little questions our readers should ask themselves. Number one is: How often are shop windows backed up in Press advertising? Number two goes on another line of argument, namely: How often are Press announcements referred to in window displays?

These two points, taken side by side, may seem somewhat paradoxical, but actually there is a lot of sense in them. Take number one, for instance. It is an almost everyday occurrence to read an advertisement in any local paper which describes at length the goods offered by the advertiser, but never a word is there about watching the windows in which the goods are displayed. Then, with regard to point number two, a man may pass the window in a hurry and scarcely notice any of the goods displayed. If, however, a large window ticket was displayed, and it had something in large print about looking in the local paper for the firm's advertisement, it is quite probable that the passer-by would spend a few minutes of his spare time in turning up the announcement referred to. These are, perhaps, only small points, but they make a big difference to the sales turnover.

* * *

NOTE.

The Editors will be pleased to hear from readers on all subjects of electrical retail trading.

Summer Window Displays.

Taking Full Advantage of the Hot Weather.

DURING the hottest part of last year, an electrical retailer in a London suburb passed the remark: "I'm on the sunny side of the street, and during the hot weather I notice that not so many people stop to look in my windows." This was, of course, a natural reaction on the part of the public, for the shady side of the street is always the most comfortable in sunny weather, and it requires something really attractive to lure people out of the shade.

That is just where this retailer failed: he did nothing to attract the public to his shop windows. He just carried on in the same old style, and lamented the failing of the public, whereas it was his own lack of initiative that was the root cause of his wilting sales.

During hot weather, special summer window displays will greatly assist the sales of cooling apparatus for the home, such as fans and refrigerators. The "prospect" will be in the right mood, and will eagerly consider any devices for combating the hot weather and lightening domestic labour. But it must be a special display. The display that is neat and attractive along the usual conventional lines will not, as a rule, attain its objective. What may be termed "summer selling punch" is a very necessary element, and the more powerful the means employed, the more convincing will be the display. To the conservative-minded this may sound somewhat of an exaggeration, but its truth has been proved up to the hilt in the past, as the following examples will show. Perhaps, too, these examples will give retailers ideas for new and original displays which will prove equally effective.

Fig. 1.—An Excellently Conceived Display for Domestic Refrigerators. It comes from America.

FAN DISPLAYS.

That the display need not be directly illustrative of the function of the article that is being pushed, and that the unusual will attract as much as the standard, was aptly shown by a provincial retailer. In his window was a charmingly dressed wax model of a girl, whose hat was being swept off her head and her skirts blown above her knees. The wind, of course, was created by two electric fans, which were prominently displayed. This is not an event that any woman would relish, naturally, but the display attracted considerable attention, and as a result a large number of fans were sold.

A display worthy of mention was that of a suburb retailer, who was fortunate in having a large windo In the centre of the window was a red-haired girl seat at a piano, while a man standing behind her w demonstrating his lung power. On one side of t window, seated in an easy chair, was an elderly m reading the evening paper, and on the other side, al seated in an easy chair, was mother busily engag in darning socks. An appearance of a sultry nig was very cleverly created. An electric fan, wi coloured ribbons attached to show the power of t breeze, was on the piano, with a card saying "T this on the Piano. That was all, yet the di play sold more th thirty electric fans less than a fortnigh The reason was, course, that the displ had a homely appeal.

An appeal of rather different nature, the a peal to the senses, w that of a West End r tailer, who draped h window in lengths coloured velvet. T back cloth was of mi night blue, carefull hung so that each fol should be perfect, an with a *papier-mâch* column at each en ornamented in silver an blue. On the floor each centre side, at slanting angle, were tw oval leather mats, dye blue, on each of which a electric fan topped mahogany pedestal, wit several more fans on th mats beside the pedestal The sides of the window were also hung with midnigh blue velvet. The display was tasteful and attractive and undoubtedly sold a large number of fans.

Another display that for sheer simplicity an effectiveness would take a lot of beating was as follows The back and the sides of the window were drape with alternate lengths of blue and yellow cloth, an the floor was covered in the same style. In the centr of the window was a single pedestal on which was on fan from which white ribbons were blown in all direc tions. At the base of the pedestal was a card heade "Summer Breezes in Your Home," and giving the pric of the fan and its running costs in relation to the loca electricity supply.

MONDAY MORNING COOLNESS.

Other domestic appliances which have a direct summe appeal, and for which special displays can be made are refrigerators, vacuum cleaners and electric washin

machines. A very cleverly designed refrigerator display, an American one, is shown in fig. 1. Of the other two, the washing machine is the most difficult to show. The following display, however, arranged by a large Liverpool retailer may create some new ideas.

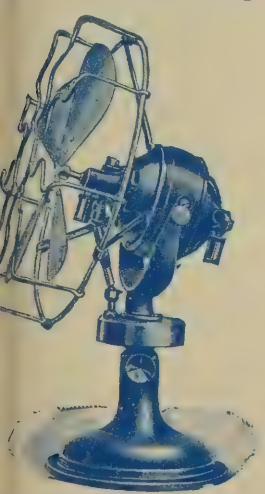
The background of the window, which was a large one, depicted the rear of a small house with a low verandah, on which a rambler rose made a brave display. Thanks to an electrical outlet, the washing machine on the verandah was gaily churning away. Apparently one batch of washing had just been completed, for the housewife, represented by a wax figure, was posed in the attitude of hanging clothes on the line across the lawn, over which artificial grass mats were laid. Her little boy was playing on the lawn with a bat and ball. Here again was the direct human appeal, and the results were very gratifying.

Fig. 2.—A General Electric Display of Fans.

THE HUMOROUS APPEAL.

As a final example we will study a humorous display of electric vacuum cleaners arranged by a Birmingham trader. A prize-fight ring was reproduced in the window, with a sprinkling of spectators in the novel form of vacuum cleaners with a face mask attached to each handle. These stood in a single line across the background, enveloped in black cloth draperies. Inside the ring, "Battling Vacuum Cleaner" had just succeeded in delivering the knock-out blow to "Kid Drudgery," a pitiful broom figure with two hand brushes for hands and a mask for his face. The referee, a very trim and smiling housewife, was counting time. A show-card in the front of the window bore the legend: "Battling Vacuum Cleaner knocks out Kid Drudgery," and underneath this, in smaller type, was an invitation to enter the shop and see the vacuum cleaners demonstrated.

In conclusion, there are one or two points that must always be borne in mind when arranging these displays. The first is that the price of the goods shown should always be part of the display, for this is invariably one of the factors that determines a sale. Even at the risk of a display losing some of its effectiveness, the price must be given. The second point is that the display should never be exaggerated—it should be as near to the truth as possible. Exaggeration only provokes distrust, and through this many a sale may be lost.

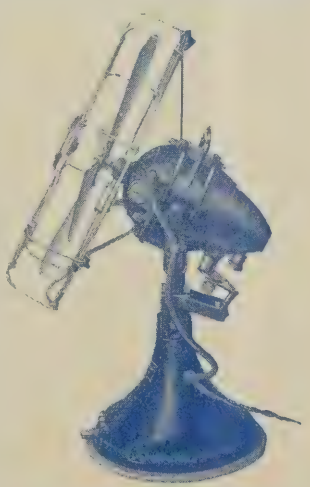


* * *

Some Domestic Electric Fans.

The present period is the proper time for pushing the sales of electric fans. In the preceding article we deal with special window displays of fans, and below we give particulars of some types of fans on the market which can be installed in the home, and for which a ready sale should be found.

THE "SUNCO" OSCILLATING TYPE.



This fan oscillates in a horizontal plane through an angle of about 110 degrees, the motion being readily stopped by the simple setting of a lever. The moving parts are exceptionally strong, simple, and quite silent in operation, while the provision of a safety clutch obviates the danger of injury to the fan through its movement being obstructed. The safety clutch operates automatically in the event of the motion being impeded, and allows it to reverse and resume its oscillatory action in another direction. It is finished in black enamel with gold relief, oxidised mounts, and is fitted with a 2-speed regulator. A knuckle joint enables it to be used either as a pedestal or as a wall bracket fan. It is sold to the trade by the Sun Electrical Co., Ltd., London.

The "Sunco" Oscillating Fan.

"MAGNET" FAN—"GYRO" TYPE.

This is an entirely new pattern. It is so constructed that the body of the motor oscillates through a sweep of 105 degrees horizontally and 45 degrees in a vertical direction, thus completing an elliptical movement and giving a maximum air displacement for a minimum current consumption. A simple device is provided for reducing the sweeps as desired down to a minimum of 44 degrees horizontally and 30 degrees vertically. As a result of this wide oscillating range, the total area swept by the fan is considerably greater than that obtained by a fan oscillating on one axis only. It is fitted with 12- or 16-inch blades as desired, and can be obtained suitable for alternating or direct current of almost any voltage and periodicity. Should any obstruction prevent the operating of the oscillating

The "Magnet" "Gyro" Fan.

Reprinted from "The Lancet," March 26th, 1927.]

The "Ajax" Portable Arc Lamp.

THE lamp which has been submitted to us is designed as a portable source of ultra-violet radiation to be taken to the patient's house and used on the ordinary house mains. Such a lamp must obviously be of reasonable size and weight, simple to use, and capable of running on any voltages direct or alternating. The instrument submitted consists of a strong metallic case, about the size and shape of a large attaché case, heavily nickel-plated, which contains a small automatic arc and the necessary resistances. The arc itself is permanently mounted at one end of the case and is not intended to be removed when in use. This makes for safety in handling and for simplicity, as the minimum of fitting-up is required. The end facing the arc forms a sliding panel which can be completely withdrawn when a wide-angled beam, suitable for the irradiation of a large area, is required. For localised treatment, the sliding front carries a diaphragm and a water-cooled chamber fitted with rock crystal windows. The water cooling is effected by a glass reservoir on the top of the instrument, convection currents causing the water to circulate between the reservoir and the water chamber. This simple arrangement was found to be quite effective for the short period required—in ten minutes the temperature of the water had risen only 7 deg. C., whilst the quartz lens, though warm, was not uncomfortably hot.

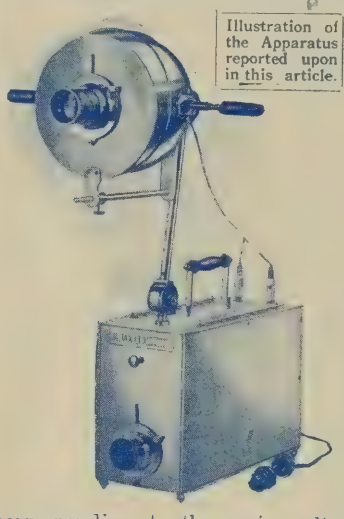


Illustration of the Apparatus reported upon in this article.

The arc is formed between cored carbons, either tungsten-cored or so-called polymetallic, the latter being cored with a mixture of metals designed to give intense radiation in the region of most therapeutic value. On the back of the instrument three knife switches are fitted. One is the main switch for the arc, the second has two positions corresponding to the main voltages of 220 and 110 respectively. The instrument is sufficiently flexible to allow of its use on other voltages varying within 10 per cent. of these values. The third switch allows the use of the magnetic blower which is fitted to the arc; this is an electro-magnet which forces the arc forward in the form of a flame when in use and thereby increases the output of radiation. The main switch has two contacts, one controlling the arc in the case and the second switching the current to a second arc which is mounted in a hood-shaped reflector carried at the end of an adjustable arm attached to the top of the case. This arc can be used with a rock crystal lens applicator as described above, but in this case, no cooling device is fitted, the heat not being so intense as for the internal type. The instrument takes about eight ampères of current, and was found on test to give a very steady output. The case tended to get hot during a prolonged run but, owing to the efficient ventilation of arc and resistances, no damage was detected. The radiation from the bare arc and also after it had passed through the applicators was examined with a Hilger quartz spectroscope. The spectra extended as far as 2,100 Angstrom units and the quartz lenses were found to be transparent over the whole range. The polymetallic carbons gave a spectrum of closely packed lines over practically the whole range. A few minor points of design—*e.g.*, the disposition of the switches on the case, call for slight modification, but they are by no means important and are already receiving the attention of the manufacturers.

In general, the "Ajax" lamp seems to be very well designed for its purpose—namely, to provide a portable source of ultra-violet rays which can be used over a wide range of varying conditions and for a number of different purposes.

Important Announcement.

A Rapidly Extending Development in the Trade.

We (AJAX Ltd.), *actual manufacturers of High-cla Electro-Medical Apparatus of all kinds, wish to draw t attention of retailers particularly to the new Artifici Sunlight Treatment Lamps.*

By the wide publicity given to the subject in the l press, everyone is aware to-day of the extraordina curative effects of the Ultra-Violet Rays and Apparat are being bought for all Hospitals and Clinics as we as Doctors in their private practices.

We consider that this trade should be done throug the usual trade channels: it is an electrician's job to f up electrical apparatus and we wish to co-operate in th closest manner possible with the trade for the supp of our Lamps.

We shall give all help possible for the establishmer of this trade: we have organised a system of speci one week demonstrations personally attended by a expert member of our staff and a system of circularisin and advertising that calls the attention of potential pu chasers to the fact that all these high-class Electr Medical apparatus can be obtained through their loc electrical supplier.

Certain tuition is necessary in the handling, use an fitting of these Lamps and this is given free either a out factory or on the traders' own premises by arrang ment.

There are no secrets for an electrician in the fitting u of these Apparatus, but certain precise indications ar necessary to facilitate the handling of them.

* * *

ULTRA-VIOLET RAY GENERATORS.

We supply three different types:—

(1) Mercury Vapour Quartz Burner Apparatus.
(2) Polimetallic and Tungsten Cored Carbon Arc
(3) Tungsten Arcs.

Various models of these apparatus serve for Collective Flood, Individual, Local and Spot Treatments: we hav suitable apparatus for all treatments.

Whilst our standard of manufacture is of the highes grade, our prices are strictly competitive and in fact lower than current market rates owing to our hug turnover.

Our Trade discounts are most liberal and we encourag trade purchasers in every way possible.

* * *

PROPAGANDA.

We advertise extensively in all the Medical papers, and we receiv enquiries from all parts; when agents are appointed, all enquirie from their districts are referred back to them and thus they acquir a certain amount of trade without expense or trouble to themselves.

When our distributing organisation is complete, with Agencies fixe in all various parts of the country, a list of the names of such Agent will be widely advertised.

The article in the preceding column is typically descriptive of ou Apparatus.

The small Tungsten-Cored Carbon Arc low-priced apparatus illus trated on the next page, "sells at sight." It is very handsomel finished and is efficient.

The Mercury Vapour type Apparatus, also illustrated on the nex page, is a standard model for Medical Practitioners.

We court immediate enquiries which will receive prompt attention.

We supply all types of Electro Medical Apparatus without exception

Our book entitled "Sunlight" Treatment, publishe at **4/6**, *Post Free* **5/-**, *gives full particulars concernin the Apparatus and the manner of treatment, and is mos useful to all purchasers of the apparatus.*

AJAX LTD. (Section E.R.D.) — *Inventors, Designers, Patentees & Manufacturers,* — *117, CENTRAL STREET, LONDON, E.C.1.*

SELLS AT SIGHT - £5 10 0

(Subject).

The New Ajax "SUNVIRAY" Portable and Stand Model Tungsten Cored Carbon Arc Lamp.

Price complete for Alternating or Direct Current, **£5 10 0**
The Best British-made, Low Price U.V.R Lamp yet Invented.

TUNGSTEN Cored Carbons, giving particularly rich output of Ultra Violet Rays. Suitable for all voltages on either Alternating or Direct currents.

CAN be used on all House lighting circuits or Power currents. It is absolutely automatic in functioning and requires no attention when in use.

THE Front view of the Portable model is one-fifth the actual size and as a Stand model one-seventh the actual size.

THE centre rod is threaded at each end and is simply screwed on and off at will.
These Lamps can be safely recommended for Home Use.

This apparatus is made on our definite principle of high-class manufacture only, and whilst the price has been reduced to a strict minimum, a full guarantee for Five Years is given with every lamp.
Tungsten Cored Carbons are the most efficient for this class of apparatus and burn steadily and noiselessly under the automatic control.
A quick-break-knife switch is fitted to prevent arcing.
The current consumption is almost negligible, being about one unit per hour.
The Aluminium plate seen between the Lamp itself and the base is part of a cooling arrangement which completely prevents overheating.
There is no difficulty in manipulation and nothing to get out of order.

There are two spherical-shaped hoods, both mobile, one inside the other—the inner one fitted with Iris Diaphragm for local or spot treatment. Having both hoods movable enables any angle of incidence desired to be obtained.

Uuique Offer. Guaranteed Maintenance.

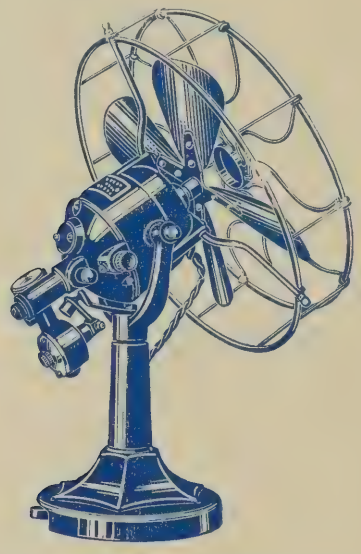
To eliminate all question of doubt of the cost of Maintenance, Replacement of Burners, in fact, a "guarantee for ever" can be obtained on payment of a small quarterly charge. *Full particulars on request by which "upkeep" is placed on a definite guaranteed basis.* Burners supplied free when required, and in fact the whole apparatus replaced should occasion arise.

Also Hospital Type Automatic Carbon Arc Lamps for collective treatment from (subject)	£35 : 0 : 0
Sinusoidal and Surging current apparatus for Galvanism and Faradism (subject)	£31 : 10 : 0
High Frequency Sets with 3 electrodes in handsome carrying case (subject)	£4 : 4 : 0

AJAX LTD. (Section E.R.D.)

— Inventors, Designers, Patentees & Manufacturers —

117, CENTRAL STREET, LONDON, E.C.1.



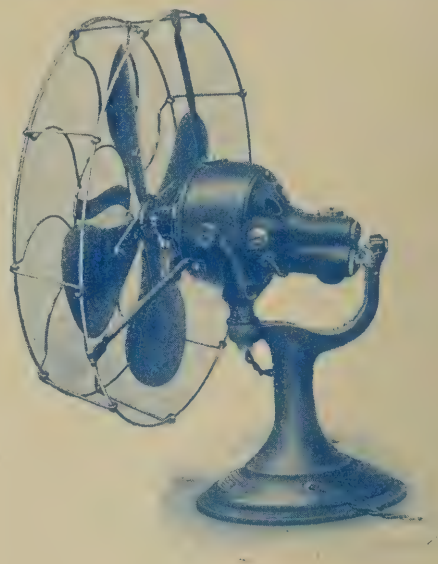
Phone: CLERKENWELL 6194. **Telegrams: COOPENGEER, BARB LONDON.** **Cables: COOPENGEER, LONDON.**

mechanism, a slipping clutch allows the fan blades to continue revolving. The motor is of the semi-enclosed series-commutator type, fitted with laminated body and poles. A regulator in the base of the fan gives three speed variations, and an "off" position, and is capable of reducing the speed of the fan by approximately 50 per cent. The resistance coils are wound on mica slabs and are liberally designed so as to enable the fan to be run continuously on any step of the regulator. It is manufactured by the General Electric Co., Ltd., London.

* * *

THE "ELLIPSO" OSCILLATING FAN.

The "Ellipso" oscillating fan, illustrated herewith, is the product of Messrs. Berkeley & Young, Ltd., Birmingham, who claim that its elliptical movement is obtained by the simplest gear yet evolved. This movement is secured through a simple traversing mechanism constituted by a single link which is connected to and rotates with a slow motion shaft. This link is anchored by a universal ball joint to a fulcrum fixed to the



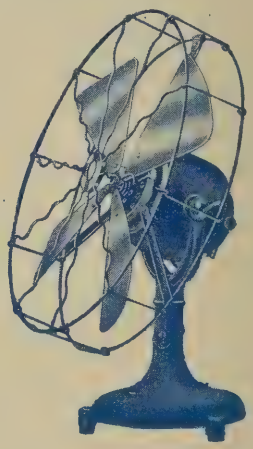
The "Ellipso" Oscillating Fan.

base. The reducing gear that transmits the drive from the motor shaft to the slow motion shaft is contained in a simple gear box integral with the motor end casing. One end of the slow motion shaft is located outside the gear box for the hinging and the single link, which is constructed to turn crankwise and is simultaneously capable of increasing or decreasing its angularity with respect to its slow motion shaft, thereby giving an elliptical traverse. A very simple and efficient friction clutch is also embodied. It is supplied with 12-in. blades for either a.c. or d.c. supply.

* * *

THE "ORBIT" ELECTRIC FAN.

Manufactured by Messrs. Veritys, Ltd., Birmingham, this fan is constructed along rather novel lines, and is distinctly pleasing in appearance. It is made for both a.c. and d.c. supply, and has a wide range of oscillating movement in all directions. An efficient and sensitive slipping clutch is provided, making it impossible to damage any part of the fan or gear should any obstruction be encountered during the oscillating action. The double worm reduction gear consists of hardened steel worm and phosphor bronze wheels, whil



The "Orbit" Fan.

the gear box is totally enclosed and dustproof. No bal joints are used in the driving mechanism. The curren consumption is low, being only 30 watts for a 12-in size fan.

* * *

THE "EDISWAN" TYPE H.326/333 FAN.

Manufactured by the Edison Swan Electric Co., Ltd. London, this appliance is for working off direct cur rent, and it can be obtained mounted as either a tabl or a bracket fan. The motor is of the ventilated type with efficient lubrication, ensuring a low-tempera ture rise after prolonged runs. In this convertibl

An "Ediswan" Fan.

bracket pattern the complete motor is supported o trunnions, and the pedestal specially jointed to permi of wall mounting when desired. This conversion i easily accomplished by means of one screw, and in con junction with the trunnion bearing enables cool air t be delivered in any direction. A 3-speed regulator i fitted in the base. The motor and pedestal are finishe in black enamel, while the blades and guards are c polished and lacquered brass.

Selling Lines for Retailers.

THE "SUNVIRAY" U-V RAY LAMP.

Manufactured by Messrs. Ajax, Limited, London, this ultra-violet ray (artificial sunlight) lamp is intended for use in mild cases, and can be used in the home equally as well as the surgery. It is supplied with a quick-break switch, which prevents arcing, and separate plug holes are provided for the different voltages, 110 and 220, each of which gives a wide margin for other voltages. When switching on the current, the arc is

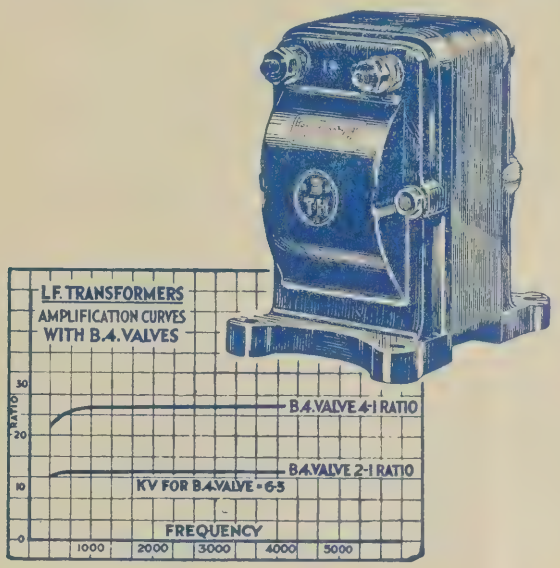
The "Sunviray" U-V Ray Lamp.

immediately struck, and the burner will function automatically until the carbons, which are tungsten-cored, are burned out. It is constructed to consume a current of 4 to 5 amps., and consequently can be used on any ordinary circuit. It does not overheat, and a special cooling device is arranged over the resistance unit by which there is free circulation of air for cooling purposes. The radiation is sufficient to cover the whole of the body at a distance of little more than 2 feet. Our illustration shows the portable model.

CASTLE TERMINALS.

There are still a considerable number of people who prefer making their wireless sets to purchasing the commercial article, and there are many who like to experiment in construction. Among the necessities of

(a) "Castle" Spade Terminal.



(b) "Castle" Wander-plug.

these people are terminals and other small gadgets, and there is usually a steady sale for these. The spade terminal and wander-plug illustrated herewith are the products of Messrs. T. L. Castle, London, who specialise in this class of work. They are made of standard brass, machined turned, and are designed with a view to saving both time and trouble.

"B.T.-H." L.F. TRANSFORMERS.

When the l.f. amplifying valves of a wireless set are transformer-coupled, it is important that the transformers should have no resonance peaks. This object is achieved when the windings of the transformers are correctly designed and their impedance is as near as

"B.T.-H." L.f. Transformer and Characteristic Curve.

possible to that of the valves used. "B.T.-H." l.f. transformers have been designed with this end in view. They are of the iron-cored, power type, and heavy gauge wire is used, this enabling large currents to be carried without fear of breakdown. The windings and core are correctly proportioned and are protected against atmospheric effects and mechanical damage by a casing of "Abrolite"—a high quality insulating compound. They are made by the British Thomson-Houston Co., Ltd., Rugby, in two ratios, 2 : 1 and 4 : 1, the lower ratio being recommended for use in the input stage and the higher ratio for use in the intermediate position.

THE BASTIAN HOT PLATE.

As may be seen from our illustration, this domestic apparatus is constructed much along the usual lines, al-

The "Bastian" Hot Plate.

though the interior arrangements differ and may be considered an improvement. The elements are of new pattern

Quartzalite, and water can be spilt over them with no likelihood of the apparatus being damaged. They are fitted to the cast-iron plate which forms the hotplate itself. They are easily removable and, if the quartz tube is undamaged, they can be rewired at a very low cost. It is made in three sizes by the Bastian Meter Co., Ltd., London.

THE "SWANLITE" GLASSWARE UNIT.

A series of tests have recently been carried out by the Edison Swan Electric Company, Ltd., London, to determine the distribution of light from their "Swanlite" enclosed glassware units. Two units, each equipped with 200-watt gasfilled lamps, were mounted at a height of nine feet above the working plane; the spacing between the units was twelve feet, and the intensity of light from each was checked at progressive distances of one foot from points immediately beneath them. In

"Swanlite" Glassware Unit.

each case the maximum intensity was 5-foot-candles, and the minimum intensity 1.25-foot-candles. The illumination was fairly even, the maximum variation being 0.5-foot-candles. As may be seen from the illustration, the unit is of the flat type, and the maximum intensity is therefore in a downward direction. It is specially suitable for the illumination of shops and stores where goods are displayed on counters, or on shelves with a height slightly less than the mounting height of the units.

"UNIVERSAL" TEST AND BATTERY CLIPS.

Manufactured by the L.P.S. Electrical Co., Ltd., London, the "Universal" test and battery clip is a stamped metal spring clip designed to facilitate the making of temporary electrical connections. It is non-corrodible, has a wide spread of jaw, and is fitted with a strong spiral spring which ensures a perfect electrical connection. It is made in two types: one for battery charging and one for small radio work. The battery-charging clips are heavily coated with lead to resist acid fumes, and are fitted with a copper shunt to prevent current passing through the spring. The small radio clips have strong springs and will grip accumulator pillars firmly. They may be used for accumulator or h.t. battery connections, tappings on transmitting inductances, and so on.

THE "UNIPIVOT" POINTER GALVANOMETER.

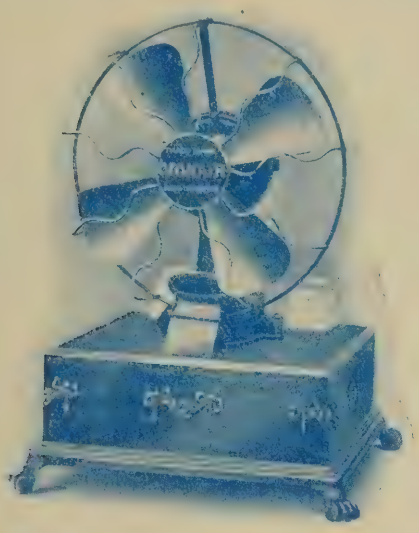
In this instrument, the movement is enclosed in an aluminium case, combining lightness with strength, and the compact design renders it easily portable, so making it very useful for laboratory work. Normally, the movement is insulated from the case but the instrument can be supplied with the case con

The "Unipivot" Pointer Galvanometer.

nected to the movement, thus enabling it to be used with a thermal junction as a wave-meter for wireless purposes; a zero adjustment and a coil-clamping device are fitted. It can also be adapted for use as an accumulator tester and as a cell-testing voltmeter. The scale, which has a length of about 75 millimetres, may be calibrated or uncalibrated as desired. Standard ranges vary from 0 to 24 microamperes to 0 to 1,200 millivolts. It is manufactured by the Cambridge Instrument Co., Ltd., London.

A NEW DESIGN OF CEILING SWITCH.

The single cord ceiling switch illustrated herewith has recently been produced by Messrs. J. A. Crabtree & Co., Ltd., Walsall. In this fitting a single cord performs both the function of switching on and switching off the



A Crabtree Ceiling Switch.

current, a single pull being all that is necessary. A cord of any desired length can be quite simply inserted in the switch acorn. The fitting is made in several finishes, and with either a flat base switch or a semi-recessed switch.

"OZONAIR" SEMI-PORTABLE FAN.

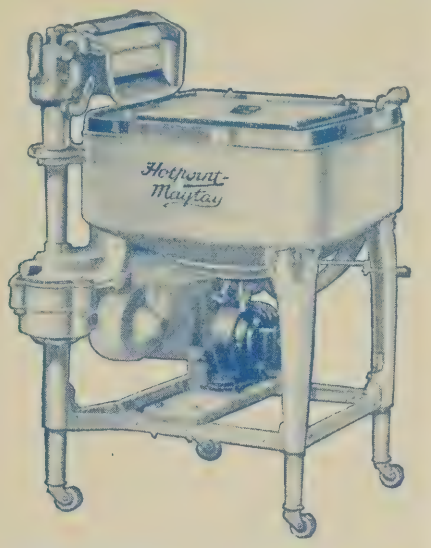
This type of electric fan, which also purifies and deodorises the air, has been specially designed for general use. It is solidly constructed, and is suitable for purifying the air in large rooms, offices, and so on, in addition to private houses. The apparatus consists of an ornamental metal base finished in oxidised copper. The generator, transformer, &c., are contained in the base. The air inlet is provided with a renewable metal

The "Ozonair" Semi-Portable Fan.

gauze air filter. Behind the fan pedestal are mounted two fuses, and between these a four-way revolving-action switch, which permits of regulating fan only, ozone strong, ozone weak, and off. It is manufactured by Ozonair, Limited, London.

THE "ADNIL" PRESS-BUTTON SWITCH.

Robustness and durability are the prominent features of this switch, which is manufactured by Messrs. S. G. Beach & Co., Ltd., London. It is constructed entirely of "Ebolite," a highly-polished insulating material of jet black colour, and its one spring is made of special phosphor-bronze; the press buttons are not screwed on, but are permanently fitted and cannot be detached

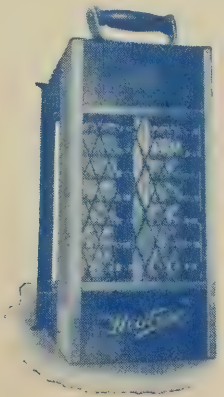


The "Adnil" Press-Button Switch.

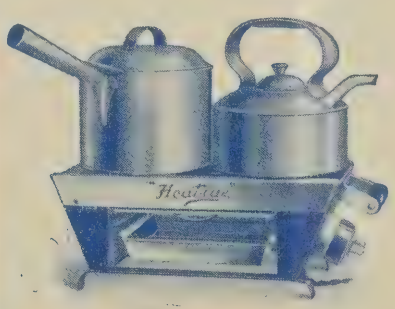
and lost. To open and to close the switch, a slight push only is required, and no trouble is experienced on account of the switch or block working loose. To close the switch, the button marked with the white spot is pushed. Each switch is carefully tested for jigging, and is supplied complete with the necessary number of black-headed fixing screws.

THE "HOTPOINT-MAYTAG" WASHING MACHINE.

This electrically-driven machine has been constructed with a view to mechanical simplicity. The drive is situated beneath the tub and works the washer, placed in the bottom of the tub, by means of a crankshaft. It works on the "gyrafoam" principle, and has a capacity of 50 lb. of family washing per hour. The tub is of aluminium, and is easily adjustable to any height. Another feature is the metal, swinging wringer attached



"Hotpoint-Maytag" Washing Machine.



to the machine. This swings into seven positions, adjusts itself automatically for handkerchiefs or blankets, and has an automatic drainboard. The suppliers are the Hotpoint Electric Appliance Co., Ltd., London.

"HEATRAE" COMBINED COOKER AND HEATER.

This domestic apparatus should find a ready sale among residents of small houses or flats. As can be seen from our two illustrations, it can be used either as a breakfast cooker or as a radiator, the necessary change-over being slight. Grilling and toasting can be done simultaneously, and it can also be used for boiling and simmering. It is strongly made in steel and

(a), as Heater.

(b), as Cooker.

The "Heatrae" Combined Cooker and Heater.

aluminium, has no breakable cast parts, and is attractively finished in stove black enamel and polished aluminium, with a wood grip lifting handle. It is made by Electric Fires, Ltd., Norwich, with either two or three spiral elements.

Stock-Keeping for the Electric Shop.

By ERIC N. SIMONS (Author of "Successful Retailing", &c.)

IN keeping stock of electrical goods systematically, a proper storage classification scheme should be instituted. It is important to know at a glance: (1) exactly what the goods are; (2) what quality they are; (3) whose make they are; (4) where they are kept.

The only way in which this information can properly be given is by means of a recording system that embodies letters and numbers as symbols. Thus, a stack of shelving could be divided into vertical sections each vertical section being designated by a letter of the alphabet. In each of these vertical sections a certain class of goods would be kept, *e.g.*, wireless valves, and so forth. In each horizontal section—since each vertical section would be sub-divided into horizontal sections—would be kept a particular kind of wireless valve. Each of these horizontal compartments would be numbered. Thus, No. 1 section might carry bright valves, No. 2 dull emitters. In each horizontal section (where the class of goods made it desirable) there would be a number of drawers, boxes, or whatever kind of bin or receptacle might be employed, and in each of these would be kept the valves of a particular brand. These receptacles would also be lettered.

If, therefore, the stock-keeper wished to send down to the sales counters a dozen Mullard dull emitters, he would examine his stock record and find an entry something after this style: "A,2.c." He would at once go to vertical stack A of his shelves, and take out of horizontal section No 2 the drawer labelled "c," in which he would find the valves he wanted. It might be regarded as desirable to record the capacity or contents of each drawer, which could be done by adding a further numeral. Thus, A.2.c.36 would mean that drawer "c" either could contain or actually did contain 36 Mullard valves.

In storing goods, those likely to be most often withdrawn and replenished should, for preference, be kept near the entrance. Heavy articles should be stored on the floor, or on the lower shelves, so that the labour of lifting is minimized. Goods sold by measurement, *e.g.*, wire, should be stored where there is room to measure off the necessary lengths. The goods should travel progressively from stock to counter, which means that the goods which have been longest in stock should automatically be the first to go down to the sales counters on demand. For this reason, the shelves or compartments should, where possible, be so arranged that new consignments can be distinguished from existing stock. This enables the stock keeper to dispose of the old stock before drawing on the new.

Articles of fair length should for preference be stored in racks. Small oddments can be safely kept in bins which should be clearly labelled with contents and capacity. Goods likely to be damaged by dust or damp should be re-wrapped if the old wrapping has burst or worked loose. When cold, damp, dryness, or heat, are likely to affect articles, the latter should be carefully protected. Above all things, the stock room should be adaptable to the varying needs of the business. Stocks and their character change constantly, and if the stock system is too rigid in its arrangement the recording system will be thrown out of gear.

To indicate the prices at which they are to be sold goods should be marked in code. These codes consist of groups of ten different letters, each letter standing for a number. The group is easily remembered by stock-keeper and assistants if it makes up a simple word or phrase. For example, "the lazy fox" would serve excellently as a price code.

* * *

New Sales Literature and Catalogues.

MESSRS. L. McMICHAEL, LTD., Wexham Road, Slough, Bucks.—A circular letter dealing with the company's radio apparatus and a blotter and leaflet (priced) advertising the "Dimic Three" receiving set.

SADIA, LTD., 30, Ely Place, E.C.1.—List H, containing illustrated details of "Sadia" water heaters and auxiliary equipment, with prices and particulars of running costs. Also a folder upon the same subject.

MESSRS. YOUNG & WILDSMITH, LTD., 20, Bloomsbury Street, W.C.1.—A net trade price list of electrical materials, accessories, and appliances.

MESSRS. GARNETT, WHITELEY & CO., LTD., Lotus Works, Broadgreen Road, Liverpool.—A series of leaflets dealing with "Lotus" radio components, including a remote-control system. Illustrated and priced.

THE MARCONIPHONE CO., LTD., 210-212, Tottenham Court Road, W.1.—Coloured showcards illustrating various types of "Sterling" variable and fixed condensers, and examples of transformers and chokes.

MESSRS. WARD & GOLDSTONE, LTD., Frederick Road, Pendleton, Manchester.—List No. E.12, describing battery eliminators for radio work, including valve, electrolytic, and d.c. types. Priced and illustrated.

SIEMENS & ENGLISH ELECTRIC LAMP CO., LTD., 38-39, Upper Thames Street, E.C.4.—May price sheet of electrical materials, appliances and accessories.

MESSRS. FREDERICK J. GORDON & CO., LTD., 92, Charlotte Street, W.1.—A priced and illustrated catalogue of the leading makes of accumulators and dry batteries and accessories.

THE HART ACCUMULATOR CO., LTD., Marshgate Lane, Stratford, E.15.—A purse folder containing an attractive pamphlet giving prices and details of "Hart" radio batteries.

MESSRS. COURTNEY, RUSSELL & CO., 65a, Holborn Viaduct, E.C.1.—A leaflet illustrating five examples of crystal electric lighting fittings.

THE EDISON SWAN ELECTRIC CO., LTD., 123-125, Queen Victoria Street, E.C.4.—This company has sent us a complete set of its catalogue section in a tidy binder. The sections are well illustrated and priced, and cover lamps, lighting fittings, fans, heating and cooking apparatus, instruments and meters, batteries, accessories, d.c. and a.c. motors, and radio apparatus.

BERRY'S ELECTRIC, LTD., 85-86, Newman Street, Oxford Street, W.1.—Two pamphlets giving particulars and prices of the "Wilton" fire and the "Fleur-de-Lis" basket and dogs. The illustrations show these to be handsome additions to the "Magicoal" series.

MR. ALLAN WRIGHT, 124, Chancery Lane, W.C.2.—A booklet containing particulars and prices of "Inventum" electric water-heating appliances.

THE WESTON ELECTRICAL INSTRUMENT CO., LTD., 15, Great Saffron Hill, E.C.1.—A priced and illustrated booklet dealing with the company's voltmeters, milliameters, galvanometers and so on, for wireless purposes.

Trade Notes and News.

The Secretary of the Radio Manufacturers' Association has sent us particulars relating to the National Radio Exhibition, which is to be held from September 24th to October 1st. Full details will be published in a later issue, but in the meantime it is interesting to note that the stand positions will be allotted by ballot among firms whose applications are received by June 14th. The primary ballot will be for exhibitors at the 1926 exhibition.

* * *

From Messrs. Ajax, Limited, we have received a copy of a book published by them entitled "*Sunlight*" *Treatment*. This deals in a practical manner with the medical benefits of ultra-violet irradiation, and gives a list of the maladies that definitely yield to this treatment, and the correct method of treatment in each case. Authoritative articles deal with the benefits of treatment, skin effects, and so on, and the book concludes with a description of the various U-V ray apparatus manufactured by Messrs. Ajax, Ltd. The book is priced at 1s. 6d.

* * *

Mr. A. W. Saulter has granted a sole licence to Messrs. Hugh Stevenson & Co., Ltd., Manchester, for the manufacture of his patent coiling device.

* * *

The General Radio Co., Ltd., has purchased Radiobats, Ltd., and has thus secured control of an English high-tension radio battery factory producing 7,500 cells per week.

* * *

A company known as Lectro Linx, Ltd., has been formed with offices at 1, 2 and 3, Ashley Mansions, Vauxhall Bridge Road, S.W.1, to undertake the exploitation of the "Clix" specialities.

* * *

Two local exhibitions of electrical domestic appliances and radio goods, one at Dover and one at Deal, were recently held by Mr. C. O. Clark, a well-known electrical retailer in those towns. The two exhibitions were a great success, being visited

by more than 3,500 people in four days, and a large number of orders were taken for radio sets, electric lighting fittings, cooking apparatus, and vacuum cleaners. Our illustration shows one of the radio stands.

* * *

Messrs. Weight & Bradley, wireless engineers, have opened premises at 14, Cross Street, Reading.

* * *

The County Electrical and Wireless Stores, Ltd., Deal, has closed its premises at 7, South Street, and the business will now be carried on at 19, High Street.

* * *

Messrs. A. Emanuel & Sons, Ltd., have opened a new electrical fittings showroom at 9, George Street, Manchester Square, W.1. A very wide selection of lighting fittings is on view.

Messrs. Hough Bros., radio engineers, have opened premises in High Street, Huntingdon.

* * *

The Mullard Wireless Service Co., Ltd., has opened a new depôt at 13, Deansgate, Manchester. The depôt will carry large stocks, and is under the management of Mr. Y. W. P. Evans.

* * *

Mr. J. E. Dawson, radio engineer, has opened new showroom premises at the corner of High Street, Boston.

* * *

Messrs. Curry's, Ltd., dealers in wireless and electrical goods, have opened a new branch business at 61, Hallgate, Doncaster.

* * *

The Fulham Electricity Department is to make an immediate start on the erection of new showrooms on the Fulham Road site. The total cost is estimated at £13,000.

* * *

We learn that the Nantwich Electrical Co. has recently opened new premises at 4, Church Lane, Nantwich.

* * *

The Bristol Electricity Department has made arrangements to give demonstrations in electric cooking at its showrooms. Bristol electrical retailers should benefit from this.

* * *

The new works of ELECTROLUX, LTD., at Luton, were formally opened by Sir Robert Horne, K.C., M.P., on May 18th. A large and distinguished company, including many well-known electrical men, journeyed down from London to attend the ceremony. The various processes connected with the production of the "Electrolux" refrigerators and vacuum cleaners were inspected. The output of both of these specialities is already considerable, but it will be doubled in the course of a few weeks.

* * *

We are informed by the Midland Electric Manufacturing Co., Ltd., that the prices of "Memette" switches have been considerably revised.

* * *

Pritchett & Gold and E.P.S. Co., Ltd. (in which is incorporated Peto and Radford) have appointed Mr. F. H. Durrant as their district representative for Northants, Beds., Berks., Bucks., Herts., and Oxfordshire.

* * *

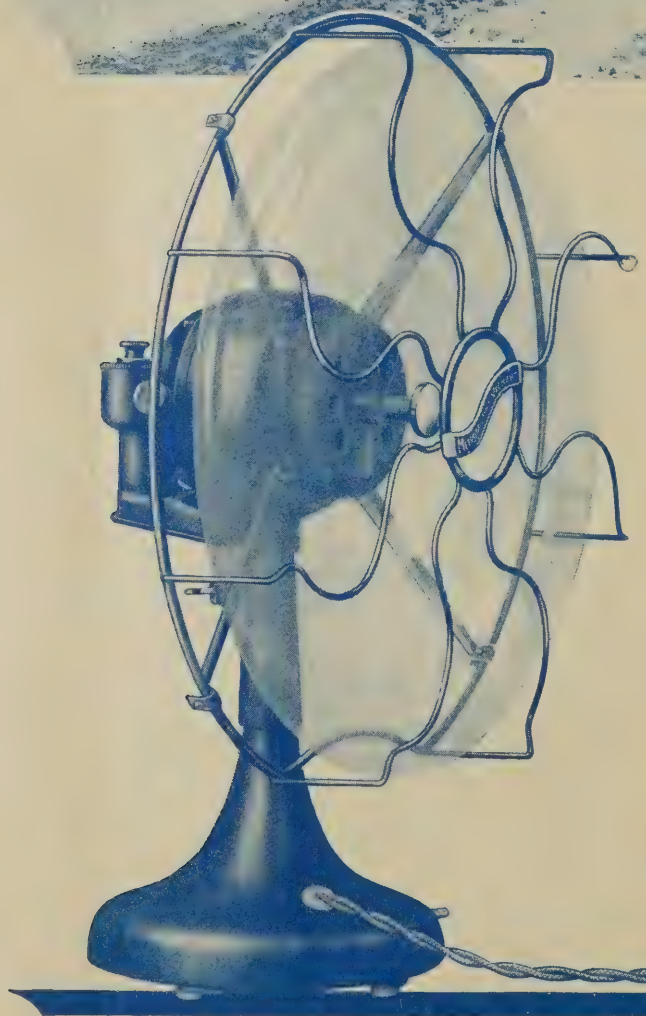
A "Brighter Homes" Exhibition is to be held in the Music Hall, Aberdeen, from September 30th to October 11th. The exhibits will embrace heating, cooking, lighting, and labour-saving appliances.

* * *

Mr. F. Sandler, wholesale electrical and wireless factor, has removed to larger premises at 2, Mayes Street, Shudehill, Manchester

* * *

Mr. Leonard J. Ive, electrical and wireless engineer, has opened new showroom premises at 11, The Parade.



* * *

"One step won't take you very far,
You've got to keep on walking.
One word won't tell folks who you are
You've got to keep on talking.
One inch won't make you very tall,
You've got to keep on growing.
One little ad. won't do at all,
You've got to keep 'em going."

BAKELITE Varnishes	The Damard Lacquer Co., Ltd., 82, Victoria St., S.W.1.
BAKELITE Varnishes	Mouldensite, Ltd., Darley Dale, Derbyshire.
BALLSOK Patent insulating beads	Lionel Robinson & Co., 3, Staple Inn, W.C.1.
BATTERSEA Carbon brushes	Morgan Crucible Co., Ltd., Battersea Works, Church Rd., S.W.11.
BATWIN Motors	Power Contracts, Ltd., 138-140, Southwark St., S.E.1.
B.C.M./A.T.M. Telephone and telegraph equipment	Automatic Telephone Mfg. Co., Ltd., Strowger Works, Milton Rd., Edge Lane, Liverpool.
B. & D. Electric drills	Gerrard & Co., Ltd., 15-19, Gt. Tichfield St., W.1.
BEANCO Switches	Baxendale & Co., Ltd., Miller St., Manchester.
BEANCO Dry cells	Baxendale & Co., Ltd., Miller St., Manchester.
BEANCO Lampholders	Baxendale & Co., Ltd., Miller St., Manchester.
BECOL Ebonite (made to Government specification)	British Ebonite Co., Ltd., Nightingale Rd., W.7.
BECOLATE High-temperature insulation material (made to Government specification)	British Ebonite Co., Ltd., Nightingale Rd., W.7.
B.E.L. Violet-ray high frequency and radiant heat apparatus	Bower Electric (1926), Ltd., 27, Ridinghouse St., Gt. Portland St., W.1.
B.E.L.L. Decorative and special lamps of all types, double-ended tubular lamps for reflector fittings, candelabra, &c.	British Electric Lamps, Ltd., Spencer Hill Rd., S.W.19.
BELLEROID Insulators	Barrett & Elers, Ltd., Dace Rd., E.3.
B.E.M. Motors	Brittain's Electric Motor Co., Eastdown Works, Dermody Rd., Lewisham, S.E.13.
BENCO Heavy duty B.C. & E.S. lampholders	Benjamin Electric, Ltd., Brantwood Works, Tariff Rd., N.17.

NAME AND DESCRIPTION.	MANUFACTURED BY OR OBTAINABLE FROM.
BENCOLITE Ornamental glass lighting unit for commercial installations	Benjamin Electric, Ltd., Brantwood Works, Tariff Rd., N.17.
BENGRIP B.C. adaptors with special cord grip features	Benjamin Electric, Ltd., Brantwood Works, Tariff Rd., N.17.
BENJAMIN Reflectors, industrial signals, automobile accessories, wireless, &c.	Benjamin Electric, Ltd., Brantwood Works, Tariff Rd., N.17.
BENJAMIN CLEARER TONE Anti-microphonic valve holders ...	Benjamin Electric, Ltd., Brantwood Works, Tariff Rd., N.17
BERLINER Automatic and telephone apparatus	Shipton Automatic Telephone System, Ltd., 37, Tothill St., S.W.1.
BERRITE Insulations and varnishes, joint box and sealing compound	Berrite, Ltd., Yiewsley, Middlesex.
BERRY Transformers	British Electric Transformer Co., Ltd., Hayes, Middlesex.
BIBBY Couplings and air filters	Wellman Bibby & Co., Ltd., Victoria Station House, Victoria St., S.W.1.
BI-POLE Tumbler switches and switch plugs	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
BIFLECTOR Reflector fitting	Benjamin Electric, Ltd., Brantwood Works, Tariff Rd., N.17.
B.K.B. All classes of motors for d.c. and a.c. battery chargers for garage and house use, a.c. and d.c. generator sets, &c.	B.K.B. Electric Motors, Ltd., 200, High Holborn, W.C.1
BLACKFRIARS Adhesive tape	Spicers, Ltd., 19, New Bridge St., E.C.4.
BLACKLEY Tape	Connolly's (Blackley), Ltd., Blackley, Manchester.
BLAKE Insulated staples	Mosses & Mitchell, Ltd., 122-124, Golden Lane, E.C.1.
BLUE LABEL Dry cell	Standard Telephones & Cables, Ltd., Connaught House, Aldwych, W.C.2.
BOTRADE Switches and distribution boards ...	S. Bill & Co., Ltd., Queen's Rd., Aston, Birmingham.
BOYCE MOTO-METER Radiator temperature indicator ...	Benjamin Electric, Ltd., Brantwood Works, Tariff Rd., N.17
BRIGHTRAY Nickel-chrome resistance material ...	Henry Wiggin & Co., Ltd., Wiggin St., Birmingham.
BRITMAC Switches and lampholders	T. M. Johns & Co., Ltd., Station Rd., Plymouth (Distributors).
BRITMAC Tumbler switches and lampholders	C. H. Parsons, Ltd., Britannia Works, Tyseley, Birmingham
BRITTAIN Motors	Brittain's Electric Motor Co., Eastdown Works, Dermody Rd., Lewisham, S.E.13.
BROWN-BOVERI Automatic pressure regulators ...	British Brown Boveri, Ltd., Trafalgar House, Waterloo Place, S.W.1.
BRUSH Tramcars, tramcar trucks, motor-'bus bodies	The Brush Electrical Engineering Co., Ltd., Falcon Works, Loughborough.
BRUSH Transformers, motors and generators, liquid starters	The Brush Electrical Engineering Co., Ltd., Falcon Works, Loughborough.
BRUSH-LJUNGSTROM Steam turbo-generators	British Electrical Engineering Co., Ltd., Falcon Works, Loughborough.
BRUSTON Electric lighting plants, pumps, and refrigerators	G. C. Pillinger & Co., 53, Victoria St., S.W.1.
BULL Motors	E. R. & F. Turner, Ltd., Ipswich, England.
BUSY BEE Vacuum cleaner	Drake & Gorham Wholesale, Ltd., 67, Long Acre, W.C.2.
CABLEGRIP Cable boxes	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.
CAB TYRE Cab tyre sheathed wires and cables	St. Helens Cable & Rubber Co., Ltd., Slough.
CAB TYRE Electric cables	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, London, E.C.1.
CABTYRIT Corrosion-resisting rubber	St. Helens Cable & Rubber Co., Ltd., Slough.
CADURO Cadmium copper wire for trolley and transmission purposes	Richard Johnson & Nephew, Ltd., Bradford Iron Works, Manchester.
CALLENDER Electric cables of all types	Callender's Cable & Construction Co., Ltd., Hamilton House, Victoria Embankment, E.C.4.
CAMBRIDGE Instruments	Cambridge Instrument Co., Ltd., 45, Grosvenor Place, S.W.1.

NAME AND DESCRIPTION.	MANUFACTURED BY OR OBTAINABLE FROM.
CASSIRER Cables and flexibles	Richards, Longstaff & Co., Ltd., 52, Gracechurch St., E.C.
C.A.V. Batteries and other electrical equipment, for cars and commercial vehicles, radio productions and l.t. and h.t. batteries	C. A. Vandervell & Co., Ltd., Acton Vale, W.3.
CECIL Resistances, fan regulators, dimmers	Mansell & Ogan, Ltd., 15-17, Cecil St., Charing Cross R. W.C.2.
CELEC Sliding resistances, dimmers, arc resistances, and charging boards	Curtis Mfg. Co., Ltd., Conduit Place, W.2.
CELERITY Rail grinders	Equipment & Engineering Co., 2 & 3, Norfolk St., W.C.
CENTRAL Electric vacuum cleaner with revolving brush	C.C.A. (Vacuum Cleaners), Ltd., "Swinton House," 322 Gray's Inn Rd., W.C.1.
CENTRALETTE Electric vacuum cleaner with fixed brush	C.C.A. (Vacuum Cleaners), Ltd., "Swinton House," 322 Gray's Inn Rd., W.C.1.
CENTURY D.C. volt ammeter test set	Elliott Bros. (London), Ltd., Century Works, Lewisha S.E.13.
C. & H. Electricity meters and instrument transformers	Chamberlain & Hookham, Ltd., Solar Works, New Barthc mew St., Birmingham.
C.H. Hand-operated and self-acting electric motor controlling apparatus and wireless components	Igranic Electric Co., Ltd., 149, Queen Victoria St., E.C.4
CHARPEEB Electric fans and irons	Charlesworth, Peebles & Co., 5, Eden St., Hampstead R N.W.1.
CHASLYN S.O.S. AND VENT TYPE Hydrometer with gravity balls ...	J. H. Collis & Co., 10, Canning Place, Liverpool.
CHLORIDE Storage batteries	The Chloride Electrical Storage Co., Ltd., Clifton Junctı near Manchester.
CIRSCALE Electrical measuring instruments ...	Record Electrical Co., Ltd., Broadheath, Altrincham, Cheshi
CITY Motors	City Electrical Co., 1, Emerald St., W.C.1.
CLARITONE Loudspeakers and headphones ...	Automatic Telephone Mfg. Co., Ltd., Milton Rd., Edge La Liverpool.
CLASSIC Pulpit, desk, piano and organ fittings	The Lodge Fittings Co., Ltd., 57, Albert Rd., Aston, I mingham.
CLEARER TONE Anti-microphonic valve holders ...	Benjamin Electric, Ltd., Brantwood Works, Tariff Rd., N.
COCUSITE Moulded bakelite material for accessories	A. P. Lundberg & Sons, Pioneer Electrical Works, Parac Passage, Sheringham Rd., N.7.
COLEC A system of heating combining central heating with electricity for topping up	Berry's Electric, Ltd., 85-6, Newman St., Oxford St., W
COMPACTUM 2-valve set	The Edison Swan Electric Co., Ltd., 123-5, Queen Victc St., E.C.4.
CORNWALL Regulators and dimmers	Donovan & Co., 47, Cornwall St., Birmingham.
COSMOS Cookers, domestic appliances, electric kitchen equipment, &c.	Metro-Vick Supplies, Ltd., 155, Charing Cross Rd., W.C.
COSMOS Lamps, fires, fans	Metro-Vick Supplies, Ltd., 155, Charing Cross Rd., W.C.
COSMOS Radiophones, radio valves and wireless apparatus	Metro-Vick Supplies, Ltd., 155, Charing Cross Rd., W.C.
COXPAR Voltage regulator	Cox-Walker & Partners, Darlington.
CRABTREE Accessories and switchgear	J. A. Crabtree & Co., Ltd., Lincoln Works, Walsall.
CRACORE Twin and three-core solid bitumen cables, cab tyre sheathed trailing cables	W. T. Glover & Co., Ltd., Trafford Park, Manchester.
CRANE WITH ELECTRIC SYMBOL (DESIGN) Electric cranes, &c.	S. H. Heywood & Co., Ltd., Reddish, Stockport.
CREDA Domestic appliances	T. M. Johns & Co., Ltd., Station Rd., Plymouth.
CREDA Heating and cooking appliances ...	Credenda Conduits Co., Ltd., Oldbury, Birmingham.
CRESSALL Resistance nets, regulators, unit heaters	Cressall Mfg. Co., Eclipse Works, 31 & 32, Tower Str Birmingham.

NAME AND DESCRIPTION.	MANUFACTURED BY OR OBTAINABLE FROM.
CROWN Cable, tape and wires	Foster Engineering Co., Ltd., Morden Works, Wimbledon, S.W.19.
CROYDON Searchlight projectors	London Electric Firm, Brighton Rd., South Croydon.
CRYPTO Generators and motors (a.c. and d.c.), constant potential equipments, commutating rectifiers, &c.	The Crypto Electrical Co., Ltd., Acton Lane, Willesden, London, N.W.10, associated with The Lancashire Dynamo and Motor Co., Ltd., Trafford Park, Manchester.
CRYSELCO Electric lamps	Cryselco, Ltd., Kempston Works, Bedford.
CRYSTALATE Insulated fittings	Crystalate Mfg. Co., Ltd., Tonbridge, Kent.
C.T.S. Electric cables	St. Helens Cable & Rubber Co., Ltd., Slough.
C.T.S. Cab tire sheathed electric cables ...	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.
CUMULUS Electric water heaters	Nathan & Allen, Ltd., 25, Victoria St., London, S.W.1.
DANIA Dry cells	Atlas Carbon & Battery Co., Ltd., 56, Southwark Bridge Rd., S.E.1.
DECO Control devices for handling plants	Dalyte Electrical Co., Deco Engg. Works, West Row, N. Kensington, W.10.
DEFORNAX Dynamo and motor brushes	J. O. Williamson, 10, Bucknall St., New Oxford St., W.C.2.
DELCO-LIGHT Lighting plants and batteries ...	Frigidaire, Ltd., Chapter St. House, Vauxhall Bridge Rd., Westminster, S.W.
DELTA Bell batteries	Falk, Stadelmann & Co., Ltd., Efesca Electrical Works, 83-93, Farringdon Rd., E.C.1.
DERI Motors, single and multi-phase, variable speed	British Brown Boveri, Ltd., Trafalgar House, Waterloo Place, S.W.1.
DETERGIO Glass brushes for cleaning commutators	J. O. Williamson, 10, Bucknall St., New Oxford St., W.C.2.
DIALITE Electric cables	St. Helens Cable & Rubber Co., Ltd., Slough.
DIAMOND Seal padlocks for slot meters ...	The Tourtel Mfg. Co., 48, Uxbridge Rd., Ealing, W.5.
DIAMOND H Switches, all types, temperature control apparatus	Hart Manufacturing Co., 76-76b, Rochester Row, S.W.1.
DIATRINE Diatrine paper-insulated cable ...	W. T. Glover & Co., Ltd., Trafford Park, Manchester.
DICTOGRAPH House and office telephones.	Dictograph Telephones, Ltd., Aurelia Road, Croydon.
DIM-A-LAMP Portable lamp with dimming device	Benjamin Electric, Ltd., Brantwood Works, Tariff Rd., N.17.
DIM-A LITE Adaptor lampholder with dimming device	Benjamin Electric, Ltd., Brantwood Works, Tariff Rd., N.17.
DISCUS Organ-blowing equipments	Watkins & Watson, 17, White Lion St., Islington, London, N.1.
DISPERSO Hand dust bellows for dispersing dust from machines	J. O. Williamson, 10, Bucknall St., New Oxford St., W.C.2.
DOT Two-pin plug connectors and switch plugs	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
DOWSING'S Electric heating and medical appliances	Dowsing Radiant Heat Co., Ltd., Bollo Lane, Acton, W.3, and 91-3, Baker St., W.1.
D.P. Storage batteries	The D.P. Battery Co., Ltd., Bakewell, Derbyshire.
DRAGON Loud speakers	Graham Amplion, Ltd., 25-26, Savile Row, London, W.1.
DRAKA Cables	Electric Cables, Ltd., 88, Golden Lane, E.C.1.
DUFLEX Control of the pendulums in existing turret clocks	Gent & Co., Ltd., Faraday Works, Leicester.
DUGDILL'S PATENTS Electric movable fittings	John Dugdill & Co., Hazelgrove, Stockport.
DULCIVOX Loud speaker	The Edison Swan Electric Co., Ltd., 123-5, Queen Victoria St., E.C.4.
DUNDEE "A" Adhesive protecting tapes	W. Geipel & Co., Vulcan Works, St. Thomas St., S.E.1.
DUNDEE "B" Adhesive protecting tapes	W. Geipel & Co., Vulcan Works, St. Thomas St., S.E.1.
DUPLEX Two-way tumbler switch with "off" position	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.

NAME AND DESCRIPTION.	MANUFACTURED BY OR OBTAINABLE FROM.
DUPLEX-A-LITE Scientific lighting unit	L. G. Hawkins & Co., Ltd., 30-35, Drury Lane, W.C.2.
DUREX Electric wiring system for C.T.S. or L.C. cables	Simplex Conduits, Ltd., Garrison Lane, Birmingham.
E Control gear, &c.	Geo. Ellison, Perry Barr, Birmingham.
EBBINITA Mouldings (not fireproof), cheap grade	Siluminite Insulator Co., Ltd., The Green, Southall, Middlesex
EDISWAN Dry batteries	The Edison Swan Electric Co., Ltd., 123-5, Queen Victoria St., E.C.4.
EDISWAN Valves	The Edison Swan Electric Co., Ltd., 123-5, Queen Victoria St., E.C.4.
EDISWAN HYMEG H.T. accumulators	The Edison Swan Electric Co., Ltd., 123-5, Queen Victoria St., E.C.4.
EDISWAN LOTEN L.T. accumulators	The Edison Swan Electric Co., Ltd., 123-5, Queen Victoria St., E.C.4.
E. & E. Railway and tramway specialities ...	Equipment & Engineering Co., 2 & 3, Norfolk St., W.C.2
EELEX Small wireless and electrical components and accessories	J. J. Eastick & Sons, 118, Bunhill Row, E.C.1.
EFESCA Switches, batteries, lampholders ...	Falk, Stadelmann & Co., Ltd., Efesca Electrical Works, 83-93, Farringdon Rd., E.C.1.
ELASTRONG Mechanical rubber	St. Helens Cable & Rubber Co., Ltd., Slough.
ELASTUMEN Cable	Johnson & Phillips, Ltd., Charlton, S.E.
E.L.E.C. Industrial lighting fittings	Engineering & Lighting Equipment Co., Sphere Works, St. Albans, Herts.
ELECT Cooking and heating apparatus, ovens, irons, fires, &c.	Electric Heating Co., George St., Croydon.
ELECTRICOAL (HEATRAE) Imitation coal fires	Electric Fires, Ltd., Heatrae Works, Norwich.
ELEPHANTIDE Insulating pressboards	B. S. & W. Whiteley, Ltd., Pool, Nr. Leeds.
ELIMINAIR Feed water deaerator	Richardsons, Westgarth & Co., Ltd., Hartlepool.
ELIXUM Quick make and break switch and fuse, ironclad fuses	Sykes & Dyson, Ltd., Queen's Mill Rd., Huddersfield.
ELLIOTT Electrical measuring instruments of all kinds	Elliott Bros. (London), Ltd., Century Works, Lewisham, S.E.13.
ELLISON Circuit breakers, electric	Geo. Ellison, Perry Barr, Birmingham.
ELLMAR Moulded pressings in bakelite and similar materials, insulating parts, &c.	The Ellmar Mouldings Co., Thimble Mill Lane, Birmingham.
ELTRON Electric hollow immersion heater ...	United British, Foreign & Colonial Agencies, Ltd., Sentinel House, Southampton Row, W.C.1.
ELWELL-PARKER Electric truck	Gillespie Partners, Ltd., Cecil House, Holborn Viaduct, E.C.
EMACO Electric fans, lighting accessories, wireless components	Enterprise Mfg. Co., Ltd., Grape St., Shaftesbury Av., W.C.
EMB Electrical control gear, resistances unbreakable, jointless and rustless, tramways trucks and brakes	The Electro-Mechanical Brake Co., Ltd., West Bromwich.
E.M.C. Electric fans, lighting accessories, wireless components	Enterprise Mfg. Co., Ltd., Grape St., Shaftesbury Av., W.C.
EMPIRE Insulating cloth and tape	Attwater & Sons, Hopwood Street Mills, Preston.
EMVEE Lampholders, switches and general accessories	Metro-Vick Supplies, Ltd., 155, Charing Cross Rd., W.C.2.
ENA Electric fires, electric heating elements	Ena Electrical Appliances, Ltd., 62, Englefield Rd., N.1.
ENDURAL Special cables and compound ...	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.
EQUATORIAL Cable	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.
EQUILUXO A special type of glassware	The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.
ERICSSON Telephones and wireless apparatus...	Ericsson Telephones, Ltd., 67-73, Kingsway, W.C.

NAME AND DESCRIPTION.	MANUFACTURED BY OR OBTAINABLE FROM.
ESLA Street lighting equipment	Electric Street Lighting Apparatus Co., The Foundry, Canterbury.
ESSELL Insulating varnished cloth, papers, tapes, &c.	Spicers, Ltd., 19, New Bridge St., E.C.4.
EVER READY Dry cells, batteries, and electric lamps (portable)	Ever Ready Co. (Gt. Britain), Ltd., Hercules Place, N.7.
EVERAY High frequency, violet ray apparatus	I. Calvete, Ltd., 11, Little Saint Andrew St., St. Martin's Lane, W.C.2.
EXAUTO Time switch	Venner Time Switches, Ltd., 45, Horseferry Rd., S.W.1.
EXIDE Storage batteries	The Chloride Electrical Storage Co., Ltd., Clifton Junction, near Manchester.
EXIDE-IRONCLAD Storage batteries	Chloride Electrical Storage Co., Ltd., Clifton Junction, near Manchester.
EXPOMETER Exposure meters for automatically controlling ultra-violet ray apparatus	Bower Electric (1926), Ltd., 27, Ridinghouse St., Gt. Portland St., W.1.
EXPRESO Switches and accessories	The General Accessories Co., Ltd., 125, High Holborn, London, W.C.1.
FABROIL Non-metallic gears	British Thomson-Houston Co., Ltd., Rugby.
FAIRYLAND Lighting strip	Imperial Lighting Co. (Implitico), Ltd., 2-6, Pocock St., S.E.1.
FALCO Electrical cooking and heating appliances	The Falkirk Iron Co., Ltd., Falkirk, N.B.
FALCO INDUCER Electrical cooking by induced current, a.c. supply	The Falkirk Iron Co., Ltd., Falkirk, N.B.
FAMOS Vacuum cleaner	T. M. Johns & Co., Ltd., Station Rd., Plymouth.
FAMOUS Electric vacuum sweeper, electrical fittings, cycle accessories	Watson's Wholesale Wireless, 2, Bigg Market, Newcastle-on-Tyne.
F.A.P. Conduit and fittings and accessories	Fitter & Poulton, Ltd., Weston Lane, Greet, Birmingham.
FARRINGDON Bells	Falk, Stadelmann & Co., Ltd., Efesca Electrical Works, 83-93, Farringdon Rd., E.C.1.
FERRANTI Meters, transformers, instruments ...	Ferranti, Ltd., Hollinwood, Lancs.
FERROZOID Nickel-iron resistance material ...	Henry Wiggin & Co., Ltd., Wiggin St., Birmingham.
FERRY Copper-nickel resistance material ...	Henry Wiggin & Co., Ltd., Wiggin St., Birmingham.
FIBRE Insulating materials	Mosses & Mitchell, Ltd., 122-124, Golden Lane, E.C.1.
FIBRESTOS Fireproof sheets	Siluminite Insulator Co., Ltd., The Green, Southall, Middlesex.
F.I.L. High tension suspension insulators	W. Geipel & Co., Vulcan Works, St. Thomas St., S.E.1.
FIREFLY Flameproof white enamel for fuse boxes	W. W. Hill, Son & Wallace, Ltd., Broughton, Manchester.
FIRIMINE Fuse switches	Berry's Electric, Ltd., 85-6, Newman St., Oxford St., W.1.
FISH-SPINE Admiralty-pattern porcelain insulating beads	Taylor, Tunnicliff & Co., Ltd., 110, Cannon St., E.C.4.
FLAMINGO Electric fires	British Electric Transformer Co., Ltd., The Tricity House, 50, Oxford St., W.1.
FLEXOTUBE Insulated sleeving	John MacLennan & Co., 115, Newgate St., E.C.1.
FLEXTOL Power driven hand tools	S. H. Morden & Co., Ltd., Morden House, 18, Dartmouth St., S.W.1.
FLUVENT Distribution fuse boxes	Parmiter, Hope & Sugden, Ltd., Vernon St., Longsight, Manchester.
FLY Magicoal fire	Berry's Electric, Ltd., 85-6, Newman St., Oxford St., W.1.
FORMAPEX Insulating varnish, moulding mixtures, miocarta sheet and tubes	Ioco Rubber & Waterproofing Co., Ltd., Netherton Works, Anniesland, Glasgow.
FOSTER Transformers, tanks, sub-station equipment	Foster Engineering Co., Ltd., Morden Works, Wimbledon, S.W.19.
FOSTER Lamps, lanterns and electrical accessories	Foster Engineering Co., Ltd., Morden Works, Wimbledon, S.W.19.
F.R.—B'HAM Copper earth clips and other accessories	F. Ryman, 116, Livery St., Birmingham.

NAME AND DESCRIPTION.	MANUFACTURED BY OR OBTAINABLE FROM.
FRANCIS Lamp lock	Francis Lamp Locks, Ltd., 83, Pall Mall, S.W.1.
FRIGIDAIRE Automatic electrical refrigerator ...	Frigidaire, Ltd., Chapter St. House, Vauxhall Bridge R Westminster, S.W.
FURSE Cinema electrical apparatus, curtain controllers, dimmers, &c.	W. J. Furse & Co., Ltd., Traffic St., Nottingham.
GAMEWELL Fire alarm systems	Standard Telephones and Cables, Ltd., Connaught Hou Aldwych, W.C.2.
GARDY Rotary switches and fuses	Thompson & Co., 1 & 3, Old Swan Lane, E.C.4.
GEAR SHIELD Gear-saving lubricant	Fred. J. Down, 90-93, Fenchurch St., E.C.3.
GECOFIX Electric light fittings of every description	The General Electric Co., Ltd., Magnet House, Kingsw London, W.C.2.
GECORAY Reflectors for shop-window lighting	The General Electric Co., Ltd., Magnet House, Kingsw London, W.C.2.
GEEKODUCT Conduits, fittings and accessories ...	The General Electric Co., Ltd., Magnet House, Kingsw London, W.C.2.
GENACCO Electric lighting accessories	The General Accessories Co., Ltd., 125, High Holborn, Lond W.C.1.
GENII Geysers, water heaters, stills, radiators, air heaters, &c.	Geo. Nobbs, Ltd., 89, Cleveland St., Fitzroy Sq., W.1.
GIANT POLIFLOR Electric floor polisher for institutions and dance halls	C.C.A. (Vacuum Cleaners), Ltd., "Swinton House," 32 Gray's Inn Rd., W.C.1.
GILSONITE Asphaltum	Ashby, Morris, Ltd., 17, Laurence Pountney Lane, E.C.4
GLASGOW-REX Ironclad switches	Midland Electric Mfg. Co., Ltd., Stafford Works, Barford Birmingham.
GLO-CLAD Watertight and gastight electric lighting system	W. T. Glover & Co., Ltd., Trafford Park, Manchester.
GLOVERS Electric wires, cables and lead-covered house wiring systems	W. T. Glover & Co., Ltd., Trafford Park, Manchester.
GLOWRAY Nickel-chrome resistance material ...	Henry Wiggin & Co., Ltd., Wiggin St., Birmingham.
GODWINEX Radio and electrical apparatus ...	J. Dyson & Co., Ltd., 5 & 7, Godwin St., Bradford.
GRAHAM Motor horns, dimmer switches, &c.	Graham Amplion, Ltd., 25-26, Savile Row, London, W.1
GRAHAM Naval telephones, band repeater and docking order equipment	Alfred Graham & Co., Ltd., St. Andrew's Works, Crof Park, S.E.4.
GRAND Electric ironer	L. G. Hawkins & Co., Ltd., 30-35, Drury Lane, W.C.2.
GREENGATE Cables	Greengate & Irwell Rubber Co., Ltd., Greengate Works, ford, Manchester.
GRIPTITE Adhesive tape	Spicers, Ltd., 19, New Bridge St., E.C.4.
GUTTAROID Insulating tape	W. T. Glover & Co., Ltd., Trafford Park, Manchester.
HÆTANIC Nickel chrome high resistance wire	L.P.S. Electrical Co., Ltd., Avenue Rd., Acton, W.3.
HAILGLASS Lighting glassware, clear, opal, coloured or decorated	Ackroyd & Best, Ltd., Beacon Works, Morley, near Lee
HAMILTON BEACH OR H. B. Vacuum cleaner, drink mixer, vibrator, &c.	S. G. Leach & Co., Ltd., 26-30, Artillery Lane, E.1.
HARCOURT Electric light fittings and door furniture	Metro-Vick Supplies, Ltd., 145, Charing Cross Rd., W.C
HARPOON Guy anchors for staying poles, &c. ...	Fred. J. Down, 90-93, Fenchurch St., E.C.3.
HART Electrical accumulators	Hart Accumulator Co., Ltd., Marshgate Lane, E.15.
HAZEMEYER Switchgear	Alan Wright, 124, Chancery Lane, W.C.2.
HEATRAE Electric heating apparatus	Electric Fires, Ltd., Heatrae Works, Norwich.
H.E.C. Static transformers	Hackbridge Electric Construction Co., Ltd., Hersh Walton-on-Thames.
HELENITE Electric cables	St. Helens Cable & Rubber Co., Ltd., Slough.
HELSBY Condensers for telephone, telegraph and power factor improvement	British Insulated Cables, Ltd., Helsby, near Warrington
HELSBY Cords (telephone and switchboard) ...	British Insulated Cables, Ltd., Helsby, near Warrington

NAME AND DESCRIPTION.	MANUFACTURED BY OR OBTAINABLE FROM.
HELSBY Rubber-insulated cables	British Insulated Cables, Ltd., Helsby, near Warrington.
HELSBY Telegraph and telephone line material	British Insulated Cables, Ltd., Helsby, near Warrington.
HELSBY Wiring systems	British Insulated Cables, Ltd., Helsby, near Warrington.
HENLEX Special compound insulation ...	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.
HENLEY Link disconnecting boxes	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.
HENLEY Distribution pillars	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.
HENLEY Tape	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.
HENLEY Cables of all types	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.
HENLEY WIRING SYSTEM Special wiring system and fittings ...	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.
HEXAPHASE System for working overhead or underground at 150,000 volts	Major A. M. Taylor, Slade Lodge, Erdington, Birmingham.
HINGELESS Fuseboard (non-corrodible detachable)	S. Bill & Co., Ltd., Queen's Rd., Aston, Birmingham.
HITEST Cables	Falk, Stadelmann & Co., Ltd., Efesca Electrical Works, 83-93, Farringdon Rd., E.C.1.
HIVOLTSIT Compressed bakelised varnish paper material, varnish insulating paper, moulded insulators to any design for any purpose	The Standard Insulator Co., Ltd., Winsley House, Wells St., Oxford St., W.1.
HOFFMANN Ball and roller bearings, steel balls and rollers	Hoffmann Mfg. Co., Ltd., Chelmsford, Essex.
HOLOPHANE Prismatic illuminating glassware ...	Holophane, Ltd., Elverton St., Vincent Sq., S.W.1.
HOMOGENEOUS Leadless non-hygroscopic cables for low and the highest tensions	Maatschappij Tot Vervaardiging Van Homogene Kabels. (Homogeneous Cables, Ltd.), 43, Stadhoudersplein, The Hague, Holland.
HOPKINSON OR H.I.M. Alternating-current motors	Hopkinson Induction Motors, Willesden Lane, North Acton, W.3.
HOT-POINT Electric irons, soldering irons and branders	Dowsing Radiant Heat Co., Ltd., Bollo Lane, Acton, W.3, and 91-3, Baker St., W.1.
HOT-POINT Domestic electric appliances	Hotpoint Electric Appliance Co., Ltd., 24, Newman St., Oxford St., W.1.
HOTPOINT-FALCO Electric cookers	Hotpoint Electric Appliance Co., Ltd., 24, Newman St., Oxford St., W.1.
H.W.S. Special wiring system and fittings ...	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.
HYPER-SCALE Electrical measuring instruments ...	Nalder Bros. & Thompson, Ltd., 97a, Dalston Lane, E.8.
ICALL Hairdryers, vibro-massage, electro medical apparatus	I. Calvete, Ltd., 11, Little Saint Andrew St., St. Martin's Lane, W.C.2.
IDEAL Electrical measuring instruments of all types	Nalder Bros. & Thompson, Ltd., 97a, Dalston Lane, E.8.
I. & F. Controller fingers, contacts and colliery coal-cutter spares and renewals	Imeson & Finch, "Empress" Works, Stockton-on-Tees.
IGRANIC All types of electric motor starting and motor controlling apparatus and wireless components	Igranic Electric Co., Ltd., 149, Queen Victoria St., E.C.4.
IGRANIC-PACENT Radio components for wireless receiving sets	Igranic Electric Co., Ltd., 149, Queen Victoria St., E.C.4.
IMP Flat tumbler switches and switch plugs	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
IMPERIAL Conduit tubes and accessories ...	Isaac Griffiths & Sons, Imperial Works, Wednesbury, Staffs.
IMPERIAL Electric stage equipment	Imperial Lighting Co. (Implitico), Ltd., 2-6, Pocock St., S.E.1.
INGLEBY Electric motors	Electric Motor & Stove Hiring Co., Ltd., Sweet St., Leeds.
INKWELL Recording instruments	Everett, Edgcumbe & Co., Ltd., 117, Victoria St., S.W.1.

NAME AND DESCRIPTION.	MANUFACTURED BY OR OBTAINABLE FROM.
INSULAC Insulating acid-proof varnish ...	W. W. Hill, Son & Wallace, Ltd., Broughton, Manchester.
INSULOIL Oil insulating varnish (stoving or air drying)	W. W. Hill, Son & Wallace, Ltd., Broughton, Manchester.
INTERMEDIATE Tumbler switch for control of lamps from more than two positions	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
INTERNALITE Signs	K.F.M. Engineering Co., Ltd., 29-31, Portugal St., Kingsway, W.C.2.
INTERNATIONAL ELECTRIC CO., LTD. Automatic telephones, intercommunicating telephones, loudspeakers, &c.	International Electric Co., Ltd., 161a-166, Strand, W.C.2.
INTERZONE Reflectors and lighting system ...	Marryat & Place, 28, Hatton Garden, E.C.1.
INVENTUM Electric fires and domestic appliances, hot-water taps	W. E. Beardsall & Co., Ltd., 5, Victoria Bridge, Manchester.
INVENTUM Fires, cookers, water heating and domestic electric appliances	Alan Wright, 124, Chancery Lane, W.C.2.
INVENTUM Electric fires, electric water taps, electric cisterns	W. C. Yuille & Co., Ltd., 155a, St. Vincent St., Glasgow, C.2.
INVENTUM Electric fires, water heating and cooking appliances	Inventum Electrical Appliances, Sales Dept., 124, Chancery Lane, W.C.2.
IRONSAFE Switchboards	Berry's Electric, Ltd., 85-6, Newman St., Oxford St., W.1.
ISCO House service cutouts	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.
IVANHOE Lighting glassware	L. G. Hawkins & Co., Ltd., 30-35, Drury Lane, W.C.2.
JACKSON Electric cookers, fires, kettles, breakfast cookers, &c	Jackson Electric Stove Co., Ltd., 143, Sloane St., S.W.1.
J.K.W. Solid-contact lampholders	J.K.W. Manufacturing Co., Ltd., 1 & 2, Bridge St., Middlesbrough.
J. & P. Wiring system	Johnson & Phillips, Ltd., Charlton, S.E.
JUBILEE Worm-drive earthing clips	L. Robinson & Co., "London Chambers," Gillingham, Kent.
K Adhesive insulating tape	F. R. Hunt, Crowther Avenue, Calverley, Nr. Leeds.
KALANITE Insulating material	Callender's Cable & Construction Co., Ltd., Hamilton House, Victoria Embankment, E.C.4.
KALANOID Plastic waterproof compound ...	Callender's Cable & Construction Co., Ltd., Hamilton House, Victoria Embankment, E.C.4.
KALBITUM Anti-corrosive paint	Callender's Cable & Construction Co., Ltd., Hamilton House, Victoria Embankment, E.C.4.
KALEECO Electric wiring system	Callender's Cable & Construction Co., Ltd., Hamilton House, Victoria Embankment, E.C.4.
KANGAROO Electric radiator	Berry's Electric, Ltd., 85-6, Newman St., Oxford St., W.1.
KANTARK Fuses, cut-outs and distribution boards	Midland Electric Mfg. Co., Ltd., Stafford Works, Barford St., Birmingham.
KARETNJA Non-hygroscopic insulating material for low and high tension cables	Maatschappij Tot Vervaardiging van Homogene Kabel (Homogeneous Cables, Ltd.), 43, Stadhoudersplein, The Hague, Holland.
KATHANODE Storage batteries	The D.P. Battery Co., Ltd., Bakewell, Derbyshire.
KAYBEE Wash boiler	Armature Winding Co., Ltd., Castle Grounds, Bury, Lancs.
KDAG Wires and cables	S. G. Leach & Co., Ltd., 26-30, Artillery Lane, E.1.
KELVEDON Hand-decorated and tinted glass and M.P. vellum shades (produced in England)	Electric Art Shades, Kelvedon, Essex.
KEY FIBRE CONDUIT Conduit and bird guards	Key Engineering Co., Ltd., 4, Queen Victoria St., E.C.4.
KILARC Positive action quick make and break tumbler switches	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
KINARKO Carbons for cinematograph work, &c.	The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.
KINGOLITE Electric candles	Edison Swan Electric Co., Ltd., 123-5, Queen Victoria St., E.C.4.

NAME AND DESCRIPTION.	MANUFACTURED BY OR OBTAINABLE FROM.
KINGSWAY Combined switch and plug	The General Electric Co., Ltd., Magnet House, Kingsway, London, W.C.2.
KLYMAX Single and two-way narrow-panel tumbler switches	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
KOMET Electric heating appliances	Electric Heating & Hardware, Ltd., Crown Works, Berkley St., Birmingham.
KONE Loud speaker	Standard Telephones & Cables, Ltd., Connaught House, Aldwych, W.C.2.
KONFORM Switch plug	Berry's Electric, Ltd., 85-6, Newman St., Oxford St., W.1.
KYE Electric lamps	Kye, Ltd., 1-3, Brixton Rd., S.W.9.
LANCASHIRE Generators and motors, synchronous motors, turbo-alternators, &c.	Lancashire Dynamo & Motor Co., Ltd., Trafford Park, Manchester, associated with The Crypto Electrical Co., Ltd., Acton Lane, Willesden, N.W.10.
LATASCALE Indicating instruments	Elliott Bros. (London), Ltd., Century Works, Lewisham, S.E.13.
LEATHEROID Insulating materials	Mosses & Mitchell, Ltd., 122-124, Golden Lane, E.C.1.
LEATHEROID Insulating materials	Attwater & Sons, Hopwood St. Mills, Preston.
LECITE Insulated cables	Liverpool Electric Cable Co., Ltd., Linacre Lane, Bootle, Liverpool.
LECTROFLATOR Tire pump, electric	Gerrard & Co., Ltd., 15-19, Gt. Tichfield St., W.1.
LEKTRIK Switches, plug connectors and kindred accessories	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
LIBERTY Super-heterodyne receiver and units	Radi-Arc Electrical Co., Ltd., Bennett St., W.4.
LIBERTY Permanent crystal detector	Radi-Arc Electrical Co., Ltd., Bennett St., W.4.
LINAPEX Varnished cloths, silks and tapes ...	Ioco Rubber & Waterproofing Co., Ltd., Netherton Works, Anniesland, Glasgow.
LINK Clips	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.
LINOLITE Reflector fittings for shop-window and cornice lighting	Beuttell, Ltd., Christopher Place, Chalton St., Euston Rd., N.W.1.
LISTER Electric lighting and power plant ...	R. A. Lister & Co., Ltd., Dursley, Gloucestershire.
LISTER-BRUSTON Generating set	R. A. Lister & Co., Ltd., Dursley, Glos.
LITHOLITE Moulded insulators	Litholite Insulators, Ltd., 55-57, Hackney Grove, London, E.8.
LITTLE GIANT Electric and pneumatic portable hand drills	The Consolidated Pneumatic Tool Co., Ltd., Egyptian House, 170, Piccadilly, W.1.
LIVERPOOL CABLES Wires and cables	Liverpool Electric Cable Co., Ltd., Linacre Lane, Bootle, Liverpool.
LOHYS Electrical sheets and stampings ...	Joseph Sankey & Sons, Ltd., Bilston, Staffs.
LORIVAL Insulating material	Lorival Mfg. Co. (1921), Ltd., Norwood Works, Southall, Middlesex.
L.P. Lamplock	G. S. Peckham & Co., 4-5, New Compton St., Charing Cross Rd., W.C.2.
L.P.S. Insulated varnished silk cambric, paper, tapes and sleevings, bakelite, &c.	L.P.S. Electrical Co., Ltd., Avenue Rd., Acton, W.3.
L.P.S. Magnet and resistance wires, cords and tungsten contacts	L.P.S. Electrical Co., Ltd., Avenue Rd., Acton, W.3.
L.P.S.-DUDLO Enamelled wire	L.P.S. Electrical Co., Ltd., Avenue Rd., Acton, W.3.
LUNAX Dustproof glassware lighting units...	Engineering & Lighting Equipment Co., Sphere Works, St. Albans, Herts.
LUNDBERG Switches, plug connectors and kindred accessories	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
LUX Storage batteries	Chloride Electrical Storage Co., Ltd., Clifton Junction, near Manchester.
LUX (LIQUID CO_2) Fire extinguishing without damage	Walter Kidde & Co. (Inc.), 2, Victoria St., S.W.1.
LYRIC Flexible cord	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.

NAME AND DESCRIPTION.	MANUFACTURED BY OR OBTAINABLE FROM.
MACADIE Automatic coil-winding machine ...	Automatic Coil Winder & Electrical Equipment Co., Welling ton House, Buckingham Gate, S.W.1.
MACONITE Insulated cables	Macintosh Cable Co., Ltd., Ashbourne Road Mills, Derby.
MACRORY Service box	Standard Telephones & Cables, Ltd., Connaught House, Ald wych, W.C.2.
MAGICLOG Electric log fires	Berry's Electric, Ltd., 85-6, Newman St., Oxford St., W.1.
MAGICOAL Electric fires	Berry's Electric, Ltd., 85-6, Newman St., Oxford St., W.1.
MAGNA V.i.r. cables and lead covered cables, &c.	Magna Wire & Cable Co., Ltd., 4, Gt. Smith St., Victori St., S.W.1.
MAGNASTART High starting torque S.C. motors ...	The Harland Engineering Co., "B.E.P." Works, Alloa Scotland.
MAGNET Electric fans of every description ...	The General Electric Co., Ltd., Magnet House, Kingsway London, W.C.2.
MAGNET Household electric appliances for heating, cooking, washing, cleaning, ironing, &c.	The General Electric Co., Ltd., Magnet House, Kingsway London, W.C.2.
MAGNET Wiring systems for general and industrial purposes	The General Electric Co., Ltd., Magnet House, Kingsway London, W.C.2.
MAGNUM Two-pin plug connectors	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradis Passage, Sheringham Rd., N.7.
MAHOGANITE Insulating material	American Hard Rubber Co. (Britain), Ltd., 13a, Fore St. E.C.2.
MANSON Adhesive protecting tape	Wm. Geipel & Co., Vulcan Works, St. Thomas St., S.E.1.
MARCONI Various types of valves for reception and transmission, bright and dull emitter for both general and special purposes	M.O. Valve Co., Ltd., Osram Works, Brook Green, Hammer smith.
MARELLI Electric fans	Marelli & Co., Ltd., 19-20, Garlick Hill, E.C.
MARVEL Tumbler switches for variable control from two or more positions	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradis Passage, Sheringham Rd., N.7.
MASTA Ironclad fuse-switches	Berry's Electric, Ltd., 85-6, Newman St., Oxford St., W.1
THE MASTER VALVE Wireless receiving, transmitting, rectifying and modulating valves	Mullard Radio Valve Co., Ltd., Nightingale Works, Nightingale Lane, S.W.2 (Manufacturers). Mullard Wireless Service Co., Ltd., Mullard House, Denmark St., W.C.2 (Distributors).
MAXIM Lamps	Poynter, Griffiths & Co., Ltd., Maxim Lamp Works, 75, Canonbury Rd., N.1.
MAXLUME Industrial and commercial lighting fittings and heating apparatus	Veritys, Ltd., Plume Works, Aston, Birmingham.
MAXTORQ Squirrel-cage type induction motors	Lancashire Dynamo & Motor Co., Ltd., Trafford Park, Manchester, associated with The Crypto Electrical Co., Ltd., Acton Lane, Willesden, London, N.W.10.
MAYTAG Electric clothes washing	Hotpoint Electric Appliance Co., Ltd., 24, Newman St., Oxford St., W.1.
M.C.L. & REPETITION Motor-car electrical equipment and automatic screw machine products	M.C.L. & Repetition, Ltd., Pool Lane, Langley, Birmingham.
M.E. Battery-charging switchboards ...	Mann, Egerton & Co., Ltd., Major's Corner, Ipswich.
M.E.C. Small electric motors, a.c. and d.c.	The Medical Engineering Co., Ltd., Englefield Rd., N.1.
MECVENT Organ-blowing equipments, forge blower, industrial fans, &c.	Millns Electrical Co., 17, Whitefriars St., E.C.4.
MEDIUM RESISTANCE Special high-quality dynamo sheets and stampings	Joseph Sankey & Sons, Ltd., Bilston, Staffs.
MEGOHMOID Cable materials	Lindsay & Williams, Ltd., Bennett St. Works, Ardwick, Manchester.
MEMETTE Ironclad switches	Midland Electric Mfg. Co., Ltd., Stafford Works, Barford St., Birmingham.
MEMREX Ironclad switches	Midland Electric Mfg. Co., Ltd., Stafford Works, Barford St., Birmingham.
MEPIC Shop-window heater and car radiator heater	Midland Electric Power Installation Co., Old Mill St., Wolverhampton.

NAME AND DESCRIPTION.	MANUFACTURED BY OR OBTAINABLE FROM.
MERIDIAN "Z" wires and cables and everything electrical	Meridian Electric Co., Baltic Chambers, 50, Wellington St., Glasgow.
MERSEY Dynamos and motors	McClure & Whitfield, Stockport.
MERSEY Motors	City Electrical Co., 1, Emerald St., W.C.1.
METROHM Insulation tester	Everett, Edgcumbe & Co., Ltd., 117, Victoria St., S.W.1.
MICANITE Insulating material	Mica & Micanite Supplies, Ltd., Offord St., N.1.
MIDGET MASTA Fuse switch	Berry's Electric, Ltd., 85-6, Newman St., Oxford St., W.1.
MILL Circuit breakers	Geo. Ellison, Perry Barr, Birmingham.
MILLER Lamps and lighting fixtures	L. G. Hawkins & Co., Ltd., 30-35, Drury Lane, W.C.2.
MILLERETTE Bathroom unit	L. G. Hawkins & Co., Ltd., 30-35, Drury Lane, W.C.2.
M.I.P. Combined 3-plate ceiling rose and two-pin plug	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
MONEL Nickel alloy, anti-corrosive metal ...	G. & J. Weir, Ltd., Cathcart, Glasgow.
MOONSTONE Glassware	Metro-Vick Supplies, Ltd., 155, Charing Cross Rd., W.C.2.
MORGANITE Brushes	Morgan Crucible Co., Ltd., Battersea Wks., Church Rd., S.W.11.
MORTISE Single-way small narrow-panel tumbler switches	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
MOSAIC Fires and paint removers	Girlings, Ltd., Electricity Works, Maldon, Essex.
MOULDENSITE Moulding powders and impregnating varnishes	Mouldensite, Ltd., Darley Dale, Derbyshire.
MUELLER Universal test clips	L.P.S. Electrical Co., Ltd., Avenue Rd., Acton, W.3.
MULPARVO A utility heater	Berry's Electric, Ltd., 85-6, Newman St., Oxford St., W.1.
N Insulating waterproof and weather-resisting tape	St. Helens Cable & Rubber Co., Ltd., Slough.
NALDER Electric measuring instruments of all types	Nalder Bros. & Thompson, Ltd., 97a, Dalston Lane, E.8.
NARROW OBLONG Two-pin panel plug connectors ...	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
N.B.D. Electrical plant	Newton Bros. (Derby), Ltd., Alfreton Rd., Derby.
N.C.S. Electrical measuring instruments of all types	Nalder Bros. & Thompson, Ltd., 97a, Dalston Lane, E.8.
NERON Electric lamps	Neron Lamps, Ltd., 1-3, Brixton Rd., S.W.9.
NESDRUM W.T. boilers	Richardsons, Westgarth & Co., Ltd., Hartlepool.
NEWBERRY Magicoal fires	Berry's Electric, Ltd., 85-6, Newman St., Oxford St., W.1.
NEWBRIDGE Time switches	Horstmann Gear Co., Ltd., Newbridge Works, Bath.
NEWTONS Dynamos, motors and train-lighting equipment	Newtons of Taunton, Taunton.
NICO Fittings and accessories	Nico Light Co., Ltd., 19, Farringdon Avenue, E.C.
NIPHAN Couplings and plugs for cables ...	Simmonds & Stokes, Ltd., 4, Vernon Place, Southampton Row, W.C.1.
NO-LAG Induction motors	British Thomson-Houston Co., Ltd., Rugby.
NOMAG Non-magnetic cast iron ...	Ferranti, Ltd., Hollinwood, Lancs.
NOVEL Switch	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.
OHMALINE Insulating varnish	Griffiths Bros. & Co. London, Ltd., Macks Rd., S.E.16.
OHMER Insulating testing sets	Nalder Bros. & Thompson, Ltd., 97a, Dalston Lane, E.8.
OKONITE Insulating tape	Wm, Geipel & Co., Vulcan Works, St. Thomas St., S.E.1.
OMEGA Electric lamps of all kinds	Omega Lampworks, Ltd., 83, Merton Rd., Wimbledon, S.W.19.
ORB Switchgear, ironclad	Geo. M'Cartney & Co., Burnside Works, Cumnock, N.B.
ORBIT Traversing desk bracket or cabin fan, for commercial or marine use	Veritys, Ltd., Plume Works, Aston, Birmingham.

NAME AND DESCRIPTION.	MANUFACTURED BY OR OBTAINABLE FROM.
OSRAM Various types of valves for reception and transmission, bright and dull emitter for both general and special purposes	M.O. Valve Co., Ltd., Osram Works, Brook Green, Hammersmith.
OSRAM Electric lamps for all conditions of lighting	General Electric Co., Ltd., Magnet House, Kingsway, London, W.C.2.
OSRAM Wireless valves of all types for general and special requirements	General Electric Co., Ltd., Magnet House, Kingsway, London, W.C.2.
OWL Porcelain	Geo. Wade & Son, Ltd., Manchester Pottery, High St., Burslem, Staffs.
OXFORD Receiving sets, special transformers	Oxford Wireless Telephony Co., Ltd., Titmouse Lane, Oxford.
OZONAIR Ozone apparatus, pure air ventilation	Ozonair, Ltd., 96, Victoria St., S.W.1.
PAKYDERM Finishing varnish	Griffiths Bros. & Co., London, Ltd., Macks Rd., S.E.16.
PARAGON Air pump	G. & J. Weir, Ltd., Cathcart, Glasgow.
PARAGON Terminals	Clarkes, "Sinnew" Works, Redditch.
PEEBLES Electrical machinery and transformers	Bruce Peebles & Co., Ltd., East Pilton, Edinburgh.
PEEL-CONNER Telephones for domestic, commercial and industrial uses	General Electric Co., Ltd., Magnet House, Kingsway, London, W.C.2.
PEERLESS Insulator and fibre	Attwater & Sons, Hopwood Street Mills, Preston.
PEERLESS Single-phase repulsion induction motors, generators and fans	S. G. Leach & Co., Ltd., 26-30, Artillery Lane, E.1.
PEERLESS Insulation paper	J. Burns, Ltd., Wangye Works, Chadwell Heath, Essex.
P.E.H. Heating apparatus	Premier Electric Heaters, Ltd., Keeley St., Watery Lane, Birmingham.
PELAPONE Country-house electric lighting plants	New Pelapone Engine Co., Ltd., 41, Baker St., W.
PERCO-WASH Electric clothes-washing device and washboiler	Jackson Electric Stove Co., Ltd., 143, Sloane St., S.W.1.
PERNAX Insulated cables, mining cables, bird guards for h.t. transmission lines	Greenwich Cable Works, Ltd., 97-99, Dashwood House, Old Broad St., E.C.2.
PERTINAX Special bakelite insulators, tubes, sheets and paper	Geo. L. Scott & Co., 69, Fleet St., E.C.4.
PETER THE HEATER Motor-car engine heater	L. G. Hawkins & Co., Ltd., 30-35, Drury Lane, W.C.2.
PETROLEX Fire extinguishers for electrical equipment	Read & Campbell, Ltd., 75, Victoria St., Westminster, S.W.1.
PHENOLITE Laminated bakelite	J. Burns, Ltd., Wangye Works, Chadwell Heath, Essex.
PHILATTA Switches	The Edison Swan Electric Co., Ltd., 123-5, Queen Victoria St., E.C.4.
PHONOPHORE Railway signalling telephone ...	Sterling Telephone & Electric Co., Ltd., Dagenham, Essex.
PINNACLE Switch fuses, enclosed fuses, &c. ...	Pinnacle Switchgear, Ltd., Weybridge, Surrey.
PIONEER Turn-type switches and switch plugs	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
PIRELLI-GENERAL Wires, cables and flexibles	The General Electric Co., Ltd., Magnet House, Kingsway, London, W.C.2.
PIVOT Single and two-way tumbler switches	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
PIVOT COMBINATION Tumbler switch and two-pin connector	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
PIVOT INTERMEDIATE Tumbler switches for control of lamps from more than two positions	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
PIXY Bell pushes with straight-line movement	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
PLANIA Arc lamp carbons, carbon brushes, carbon battery plates, &c.	Wm. Geipel & Co., Vulcan Works, St. Thomas St., S.E.1.
PLASTOL Plastic insulating compound ...	Geo. Ellison, Perry Barr, Birmingham.

NAME AND DESCRIPTION.	MANUFACTURED BY OR OBTAINABLE FROM.
P.M. VALVES Dull filament receiving valves ...	Mullard Wireless Service Co., Ltd., Mullard House, Denmark Street, W.C.2 (Distributors). Mullard Radio Valve Co., Ltd., Nightingale Works, Nightingale Lane, S.W.12 (Manufacturers).
POLIFLOR Electric floor polisher, for medium-sized rooms	C.C.A. (Vacuum Cleaners), Ltd., "Swinton House," 322-6, Gray's Inn Rd., W.C.1.
PRACHE Foundations for preventing vibrations	Fred. J. Down, 90-93, Fenchurch St., E.C.3.
PREMIER Fires	Premier Electric Heaters, Ltd., Keeley St., Watery Lane, Birmingham.
PREMIER Accumulators	Premier Accumulator Co. (1921), Ltd., Cattle Market Rd., Northampton.
PREMIER Electric vacuum cleaner	Hotpoint Electric Appliance Co., Ltd., 24, Newman St., Oxford St., W.1.
PREMIER DUPLEX Electric vacuum cleaner	Hotpoint Electric Appliance Co., Ltd., 24, Newman St., Oxford St., W.1.
PRESCOT Box compounds	British Insulated Cables, Ltd., Prescot, Lancs.
PRESCOT Feeder pillars	British Insulated Cables, Ltd., Prescot, Lancs.
PRESCOT Joint boxes	British Insulated Cables, Ltd., Prescot, Lancs.
PRESCOT Overhead equipment for electric railways and tramways	British Insulated Cables, Ltd., Prescot, Lancs.
PRESCOT Paper-insulated cables	British Insulated Cables, Ltd., Prescot, Lancs.
PRISMATIC Bulkhead fitting	Berry's Electric, Ltd., 85-6, Newman St., Oxford St., W.1.
PROMETHEUS Electric irons, radiators, water heaters, &c.	Dowsing Radiant Heat Co., Ltd., Bollo Lane, Acton, W.3, and 91-3, Baker St., W.1.
PROTOS Electric vacuum cleaner	Charlesworth, Peebles & Co., 5, Eden St., Hampstead Rd., N.W.1.
PUL-SYN-ETIC Electric impulse clocks	Gent & Co., Ltd., Faraday Works, Leicester.
QUASI-ARC Electric welding	Quasi-Arc Co., Ltd., 15, Grosvenor Gardens, S.W.1.
QUEAD Electric fires and cookers	Wm. Geipel & Co., Vulcan Works, St. Thomas St., S.E.1.
QUICKFIX Patent gallery	Charlesworth, Peebles & Co., 5, Eden St., Hampstead Rd., N.W.1.
QUICKWAY Coil-winding machines	Midland Dynamo Co., Ltd., Volta Works, Leicester.
RADIODESCENT Appliances for radiant heat treatment	Dowsing Radiant Heat Co., Ltd., Bollo Lane, Acton, W.3, and 91-3, Baker St., W.1.
RADIOLUX Loud speakers	Graham Amplion, Ltd., 25-26, Savile Row, London, W.1.
RADIOMATIC Broadcast receivers	Gent & Co., Ltd., Faraday Works, Leicester.
RADION Insulating material	American Hard Rubber Co. (Britain), Ltd., 13a, Fore St., E.C.2.
RECORD Insulation testers, battery cut-outs, circuit breakers	Record Electrical Co., Ltd., Broadheath, Altrincham, Cheshire.
RECORD Electric vacuum cleaner with fixed brush	C.C.A. (Vacuum Cleaners), Ltd., "Swinton House," 322-6, Gray's Inn Rd., W.C.1.
REDRAY Nickel-chrome resistance material ...	Henry Wiggin & Co., Ltd., Wiggin Street, Birmingham.
REESILEO Oils, insulating and lubricating ...	Reesoils, Ltd., 1, Eldon Sq., Newcastle-on-Tyne.
REFLEX Control of the pendulums and unification of existing workman's registers	Gent & Co., Ltd., Faraday Works, Leicester.
REGAL Ebonite	Spicers, Ltd., 19, New Bridge St., E.C.4.
RELIANCE Circuit breakers	Whipp & Bourne, Castleton, Manchester.
REMY Permanent tungsten steel magnet and magnet steel	W. F. Dennis & Co., 70, Queen Victoria St., E.C.4.
REPELLITE Insulating sheets	Spicers, Ltd., 19, New Bridge St., E.C.4.
RESISTON Insulating material	American Hard Rubber Co. (Britain), Ltd., 13a, Fore St., E.C.2.

NAME AND DESCRIPTION.	MANUFACTURED BY OR OBTAINABLE FROM.
RESTFULITE Electric standards	Berry's Electric, Ltd., 85-6, Newman St., Oxford St., W.1.
REVERSING Tumbler switch, with or without "off" position	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
REX A.c. meters	Thompson & Co., 1 & 8, Old Swan Lane, E.C.4.
R.L.M. Reflector fitting	Benjamin Electric, Ltd., Brantwood Works, Tariff Rd., N.17.
RODALUX Street-lighting reflector fitting ...	Benjamin Electric, Ltd., Brantwood Works, Tariff Rd., N.17.
ROTAX Electrical equipment, motor accessories, wireless receivers, &c.	Rotax (Motor Accessories), Ltd., Willesden Junction, N.W.10
ROYAL Vibrators and hair dryers	L. G. Hawkins & Co., Ltd., 30-35, Drury Lane, W.C.2.
ROYAL EDISWAN Lamps	Edison Swan Electric Co., Ltd., 123-5, Queen Victoria St., E.C.4.
ROYAL EDISWAN Fullolite lamps	Edison Swan Electric Co., Ltd., 123-5, Queen Victoria St., E.C.4.
RUPTOR Switch	W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.
RUTTER Patent wood pole for overhead transmission	Richard Wade, Sons & Co., Ltd., Hull.
SADIA Automatic water heater	Sadia Electrical Apparatus, 30, Ely Place, E.C.1.
SAFETEE Switches	L. Weekes (Luton), Ltd., Langley St., Luton, Beds.
SAFUSE Fuses and combined switch fuse ...	Donovan & Co., 47, Cornwall St., Birmingham.
ST. HELENS Cab tyre sheathed (C.T.S.) cables, dialite cables	St. Helens Cable & Rubber Co., Ltd., Slough.
ST. HELENS Ebonite, corrosion-proof fittings ...	St. Helens Cable & Rubber Co., Ltd., Slough.
ST. HELENS Insulating matting, insulating gloves, insulating shoes	St. Helens Cable & Rubber Co., Ltd., Slough.
SALFORD Circuit breakers	General Electric Co., Ltd., Magnet House, Kingsway, London, W.C.2.
SANGAMO-EDISWAN Meters	Edison Swan Electric Co., Ltd., 123-5, Queen Victoria St., E.C.4.
SANTON Switching plugs, geysers, wash boilers, &c.	Santon, Ltd., Dock St., Newport, Mon.
SAUTER Time switches, thermostats	Nathan & Allen, Ltd., 25, Victoria St., London, S.W.1.
SAVELITE A.c. incandescent lamp	Philips Lamps, Ltd., 145, Charing Cross Rd., W.C.2.
S Ironclad switchgear	T. M. Johns & Co., Ltd., Station Rd., Plymouth.
S & C Brass and steel repetition productions, turned from bar on capstan and automatic lathes and also pressings from sheet	Spears & Co., Capstan Repetition Works, 68, Park Rd., Hockley, Birmingham.
SAX Electric bells, indicators and accessories	Julius Sax & Co., Ltd., 24a, High St., Bloomsbury, W.C.2.
SAX Wall plugs and electric light accessories	Julius Sax & Co., Ltd., 24a, High St., Bloomsbury, W.C.2.
SAXONOR Switch plug (interlocking)	Julius Sax & Co., Ltd., 24a, High St., Bloomsbury, W.C.2.
SCHERBIUS Phase advancers and a.c. motor speed regulators	British Brown Boveri, Ltd., Trafalgar House, Waterloo Place, S.W.1.
SCRULIX Guy anchors for staying poles, &c.	F. J. Down, 90-3, Fenchurch St., E.C.3.
SECURA Insulating sleevings	Brasse, Ltd., Manor Works, High St., Hornsey, N.
SEECOL Modern stage lighting equipment ...	Strand Electric & Engineering Co., Ltd., 24, Floral St., W.C.2.
SELCO Syrens, motors, fans	S. G. Leach & Co., Ltd., 26-30, Artillery Lane, E.1.
SELZ Lamp shades	Charles Selz, 47, New Cavendish St., W.1.
SEMAPHITE Cables	Johnson & Phillips, Ltd., Charlton, S.E.
SERIES-PARALLEL Tumbler switch with or without "off" position	A. P. Lundberg & Sons, Pioneer Electrical Works, Paradise Passage, Sheringham Rd., N.7.
SERVICE Unbreakable, non-rusting and rigid grid resistances	The Rheostatic Co., Ltd., Mackenzie St., Slough, Bucks.

NAME AND DESCRIPTION.	MANUFACTURED BY OR OBTAINABLE FROM.
SERVICE Electric domestic appliances	The Rheostatic Co., Ltd., Mackenzie St., Slough, Bucks.
SHAYDOLITE Lamp lacquer	Griffiths Bros. & Co., London, Ltd., Macks Rd., S.E.16.
SHIPTON Automatic telephone systems ...	Shipton Automatic Telephone System, Ltd., 37, Tothill St., S.W.1.
SIEMENS Electric lamps	Siemens & English Elec. Lamp Co., Ltd., 38 & 39, Upper Thames St., E.C.4.
SIFAM Electrical measuring instruments and instrument transformers	Sifam Electric Instrument Co., Ltd., 10a, Page St., Westminster, S.W.1.
SIFTRON Filter circuits	Graham Amplion, Ltd., 25-26, Savile Row, London, W.1.
SILOLUXE Quiet, closed-bag type, electric vacuum cleaner	C.C.A. (Vacuum Cleaners), Ltd., "Swinton House," 322-6, Gray's Inn Rd., W.C.1.
SILOVAC Silent electric vacuum cleaner ...	C.C.A. (Vacuum Cleaners), Ltd., "Swinton House," 322-6, Gray's Inn Rd., W.C.1.
SILUMINITE Switchboards, mouldings	Siluminite Insulator Co., Ltd., The Green, Southall, Middlesex.
SILVALUX Electric lamps (opal)	Siemens & English Electric Lamp Co., Ltd., 38 & 39, Upper Thames St., E.C.4.

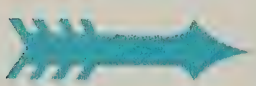
FACTS



Worthy of Careful Study and Attention.

YOU WOULD EXPECT

the leading Electrical Journal to reach the Municipal and Company Supply undertakings, Power and Lighting Contractors, Electrical Manufacturers, Consulting Engineers, and generally everyone whose business is primarily Electrical.

BUT DO YOU KNOW

that in addition to completely covering these, the subscription list of THE ELECTRICAL REVIEW for *The British Isles alone* includes the following :—

Air Filter Manufacturers.
Aluminium Works.
Asbestos Works.
Baking Machinery Manufacturers.
Ball Bearing Manufacturers
Bitumen Works.
Boiler Makers.
Boiler Fittings Makers.
Brass Works.
Breweries.
Brewery Machinery Manufacturers
Calculating Machine Makers.
Cement Works.
Chemical Works.
Chocolate Factories.
Cocoa Factories.
Collieries.
Colliery Machinery Makers.
Co-operative Stores.
Copper Smelters.
Cotton Mills.
Dye Works.
Engine (all type) Makers.
Foundries.
Gas Mantle Manufacturers.
Gas Works.
Gear Makers.
Glass Works.
Gramophone Manufacturers.
Hotels.
Insurance Companies.
Iron Works.
Machine Tool Makers.
Machinery Exporters.
Mechanical Stoker Manufacturers.
Metal Merchants.
Metal Works.
Motor Car Manufacturers.
Oil Companies.
Paper Mills.
Patent Food Manufacturers.
Printing Machinery Manufacturers.
Public Works Contractors.
Pump Makers.
Railway Store Contractors.
Retail Stores.
Rolling Mills.
Sanitary Appliance Makers.
Sanitary Engineers.
Saw Mills.
Scientific Instrument Manufacturers.
Sheep Shearing Machinery Makers.
Ship Breakers.
Shipbuilding Yards.
Steel Works.
Soap Works.
Structural Engineers.
Sugar Refiners.
Textile Mills.
Tin Plate Works.
Tobacco Factories.
Tube Makers.
Valve Makers.
Wire Workers.

THIS IS IMPORTANT

because if your advertisement does not appear in the "REVIEW," you are likely to be forgotten by the enormous purchasing field represented above.

THE ELECTRICAL REVIEW, LTD.,

:: 4, LUDGATE HILL, LONDON, E.C.4. ::

VERITYS, LTD.,

Fans have been recognised as a necessity for health and comfort from the earliest ages, and in every country and clime they have always retained their popularity. Different types of fans have been used to denote rank, fashion, etc., but their main object has always been health and comfort.

In electric fans undoubtedly the greatest development in design is the "**ORBIT**" movement, which gives a breeze in all directions, up and down, right and left,

PRICE:

£4 : 4 : 0

(SUBJECT.)

Packed and delivered free.

A.C. and D.C.

THE BREEZE IS HERE, THERE, and EVERYWHERE.

For comfort and effective cooling over a wide area the "ORBIT" Fan is far superior to the ordinary Oscillating Fan, which gives a breeze in one plane only.

STOP!

There is no need to continue to use castings in the production of many of your non-ferrous parts. After all, in castings you have to buy MORE METAL to obtain the same part, you have to PAY MORE for machining and you have MORE SCRAP! In addition, castings call for a far greater expenditure of time to produce a similar article!

Take the modern line of action; change to 'McKechnie' Solid Metal Pressings and Stampings and save in more directions than one. We can supply them in Brass and Bronze for most purposes ranging in weight from 1 oz. to 6 lbs., and our Pressings Folder illustrates what we are doing for manufacturers in all spheres of activity. Will YOU write for it and, incidentally, let us quote you for your needs?

SELL THEM LIGHT—

Who? The Shopkeepers, Factory Managers, Hotel Proprietors, Motor Car Manufacturers, Hospital Boards, Cinema Theatres, Billiard Halls, Chapels, Churches and Domestic Users.

Someone secures all this wealth of business.

Why not you?

You have the goods to sell in Cryselco Lamps, for there is one for every conceivable purpose, from a small motor car lamp to a high wattage gasfilled lamp for public lighting.

With the Cryselco line you can go *anywhere* and get business. Your goods are right, service is right.

SELL THEM LIGHT. If they have not enough light sell them more light than they have ever had before.

It pays to SELL THEM LIGHT.

Sell them Light—Cryselco Light.

CRYSELCO LAMPS

Tell your Customers these truths. Sell them LIGHT.

Cut out the panel above and put in your window—with some Cryselco Lamps.

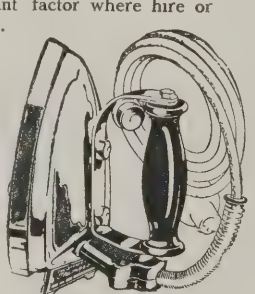
The First L.C.C. Housing Scheme



We are pleased to record the fact that in the first London County Council Housing Scheme (Castlenau Housing Estate, Barnes) to be equipped with electric heating and cooking appliances, PREMIER "Accident-Proof" Electric Kettles, and PREMIER "Smoothwell" Irons were chosen.

We have always urged the fact that implicit faith may be placed in the after-service of PREMIER apparatus, and this latest instance is representative of a growing appreciation of the truth of our claim.

The PREMIER Electric Kettle here illustrated is provided with the patent Accident-proof device by which no harm can come to the kettle in the event of it boiling dry. The considerable saving in maintenance and renewal thus effected will be readily appreciated. The finish is in the best PREMIER style and embodies the best accepted principles of design.

Wherever and in whatever circumstances, within reason, PREMIER Appliances are used, they will give such service as reduces maintenance and renewal costs to an absolute minimum—an all-important factor where hire or hire-purchase operation is involved.

The PREMIER "SMOOTHWELL" Iron embodies all the PREMIER principles of artistic design, utmost serviceability, efficiency and low current consumption. It is finished in double weight nickel plating, provided with Thumb Rest, solid terminals, and neat back stand.

Large stocks of PREMIER Electric Kettles, Irons, Saucepans, Urns, Fires, etc., are kept by the principal Electrical Wholesalers. Illustrated list giving full details will be gladly sent on request.

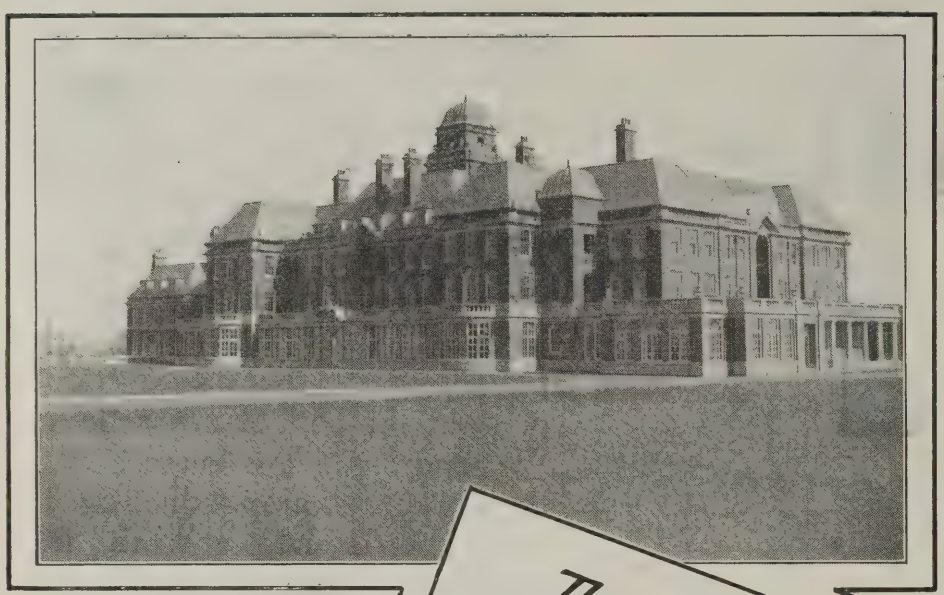
Buy value and forget the price

The price of a Parkinson machine will mislead you, forget it for the moment. And then on merit compare it with the most expensive A.C. motor you know. Go over it point by point: machining, windings, insulation and finish. At the worst you'll find Parkinson equal on every count, we believe that you will find it better.

Now come back to price for a moment. You know the important part that production plays in the cost of any article. We are using production methods that collectively are not duplicated in an Electric Motor Works in the world. The labour operating on Parkinson machines is scientifically applied. There is no waste action. We have never attempted to economise on material—nothing but the best is good enough, but on labour we have saved enormously—one piece of machining we reduced from 5/- to 5d. and machined it BETTER.



We pay higher wages than is usual, well above trades union rates—we get our pick of workmen—and we make a better motor at a lower price.

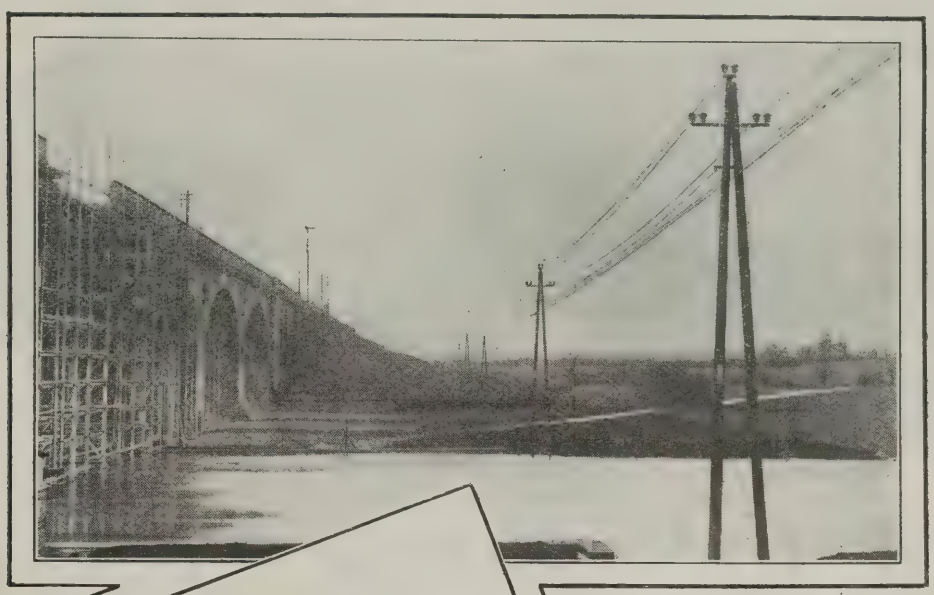
one of the P paaes

The Miner's dream of home

A DREAM which will come true when H.R.H. The Prince of Wales opens, on June 28th, the building illustrated. It is the Lancashire and Cheshire Miners' Convalescent Home at Blackpool, and the cost of the seven-acre site and of the building and equipment, amounting to more than £160,000, has been met by weekly subscriptions by the miners and by contributions from colliery managements.

It is fitting that electricity, the clean form of the energy latent in coal, should contribute towards the comfort of convalescent coal-getters. The lighting points alone number 800, and electricity is also used for heating and ventilating the 100 rooms, and for cooking for as many as 150 patients.

The Architects for this fine building were Messrs. Bradshaw, Gass and Hope, and the whole of the electrical installation was carried out by Mr. G. Morrison, of Blackpool. The bulk of the wiring consists of 2,500 megohm grade Association Cable drawn into galvanized conduit, the main feeder cable being paper insulated and lead covered.



The Miners' Home is the first building of its kind, and was wired throughout with cables which rank, in point of quality, with the first of their kind; in short, with J. & P. Cables.

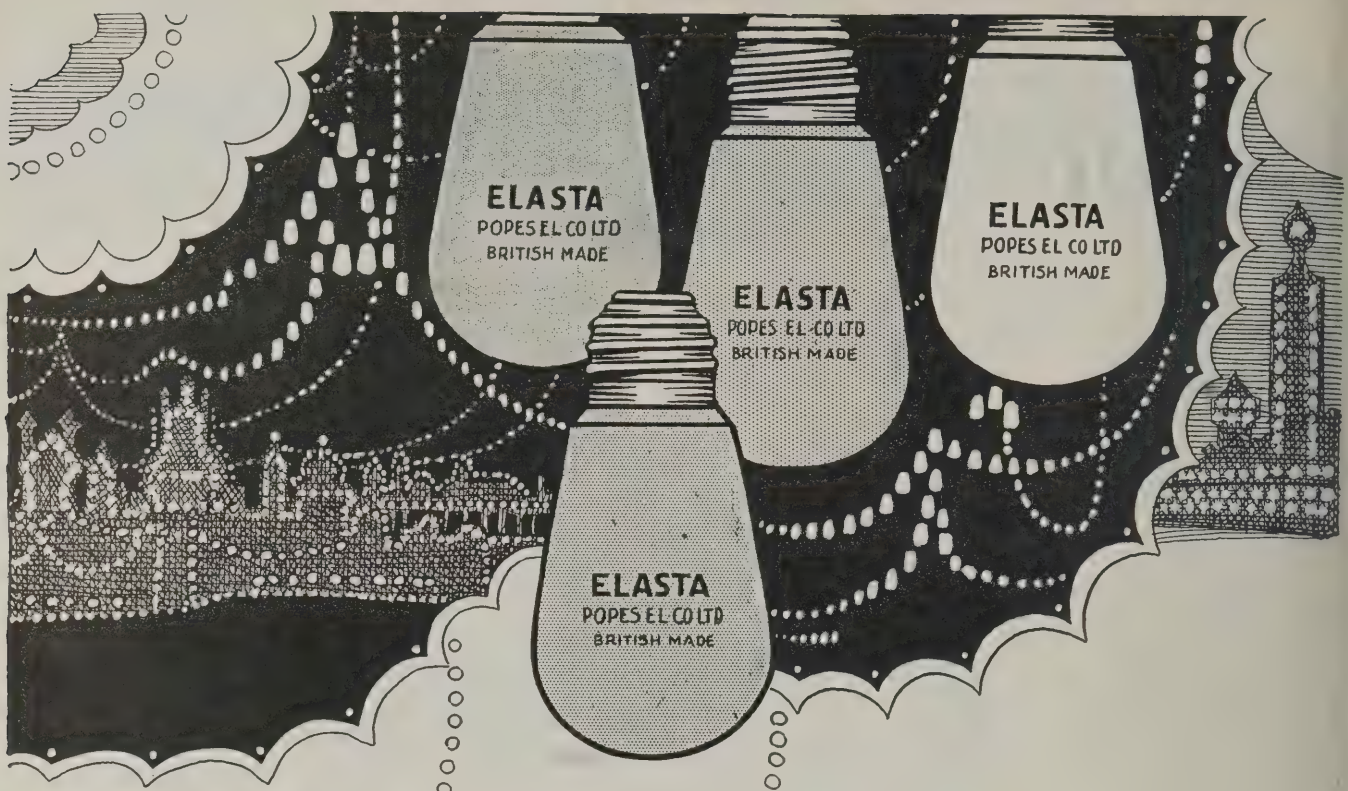
Main Lines

OVER the bridge and along the embankment run trains from London to Liverpool and Holyhead, to Manchester, Glasgow, and Aberdeen. Passengers in these trains travel secure in the unique reputation for safety which our railways possess. This is the L.M.S. Main Line at Wolverton—a line which is claimed to be "the finest permanent way in the world."

Parallel to the railway runs a line of another kind; a 33,000 volt, 3-phase line transmitting power from Wolverhampton to Wolverton. An ordinary example of J. & P. overhead line construction, but ordinary only because in electrical and mechanical design and construction it ranks with every other J. & P. line, and with the best lines of the kind in the world.



The river at this point is used as a bathing pool. The bathers, if they think about the matter at all, are probably as confident that the electric power line will not fall on them as they are that the bridge will not collapse, because engineers are expected to take every precaution necessary to prevent such happenings. The engineers who placed the contract for the line, and who certainly did think about the matter, were confident that in entrusting the work to J. & P. they were taking the only precaution necessary to obtain complete satisfaction.

You can take the same simple precaution by placing orders for Overhead Lines, or for Cables, Switchgear and Transformers with—

In all corners of the earth

No traveller landing in an out-of-the-way corner of the earth need be surprised to stumble across a packing case with the familiar ORMOND stamped upon it. For wherever there is progress and machinery, there Ormond screws may be expected. European and Continental engineers recognise the reliability of Ormond screws and constantly specify them for jobs that must be mechanically perfect. Power plants, electrical and engineering installations, in almost every country under the sun have Ormond screws built into them. Even the ships and trains that carry them to these countries rely on Ormond screws.

If ever you have to specify metal screws, get quotations and samples from Ormond. You will find their quality well over standard and their prices below those of foreign competitors because of their mass production.

72 BEDROOMS

Application for membership should be sent to "The Secretary" at the above address.

SITUATIONS VACANT.

Latest time for receiving, 5 p.m. Tuesday.

If letters are not to be delivered to certain firms or individuals (if known), instructions to that effect should be sent to the Manager of the ELECTRICAL REVIEW, who will do his best to carry out such instructions. Letters of applicants cannot in such cases be returned to them, nor can the names of Advertisers using a number in any way be disclosed.

Original Testimonials should never be sent.

ELECTRICAL ENGINEER.

THE GOVERNMENT of BIHAR and ORISSA require the services of an

Electrical Engineer for the Public Works Department.

Candidates must be Corporate Members by examination of the Institution of Electrical Engineers (London), or hold an equivalent Electrical Engineer's degree of a recognised University. At least seven years' practical experience in electrical engineering is essential. Age between 31 and 36 years.

The appointment is pensionable, subject to one year's probation. Pay in accordance with an age-scale, *e.g.*, age 31, Rs. 775 a month, plus overseas pay £25 a month; age 35, Rs. 975 a month, plus overseas pay £30 a month. (Overseas pay admissible only to an officer of non-Asiatic domicile). Free first-class passage to India. Strict medical examination.

Further particulars and forms of application may be obtained (upon request by post-card) from the Secretary to the High Commissioner for India, 42, Grosvenor Gardens, London, S.W.1. Last date for receipt of applications, July 7th, 1927. 3860

SHANGHAI.

TELEPHONE Maintenance Inspectors are required by the Shanghai Mutual Telephone Co., Ltd., Shanghai. Candidates must have good knowledge and experience of manual exchange switchboards and apparatus. Preference will be given to applicants having experience with the rotary automatic system. Age not over 25 years, and preferably unmarried. Commencing salary 250 taels per month (present rate of exchange 2s. 6d.) for first year, with probable increases to 275 taels and 300 taels per month for second and third years. Contract for three years, with second-class passage out and home. Six months' home leave after second term of three years if re-engaged.

Applications in writing only, giving age and full particulars of experience, with copies of three recent testimonials and names of references as to character, to be sent to Messrs. Preece, Cardew & Rider, 8, Queen Anne's Gate, Westminster, S.W.1, not later than the 11th July, 1927. Envelopes to be marked on top left-hand corner "Maintenance Inspectors." 3908

ELECTRICIAN wants work, town or country; 20 years' experience.—Long, 49, Alexander Road, N.19. 8583

ELECTRICIAN, screwed, slip, all systems. Capable workman; experienced. Excellent references.—Weston, 33, Grosvenor Park, Camberwell. 8581

ELECTRICIAN, 15 years' varied experience; power, lighting, bells, &c. Age 32.—Croser, 4, Cobham Road, N.22. 8511

ELECTRICIAN, good experience, all branches; day work or contract.—S., 30, Ringmer Avenue, Fulham. 8521

ELECTRICIAN and Fitter; plant and machinery, erection or maintenance; last situations 11 years and 5 years; maintenance preferred.—Cross, 40, Crossley Street, London, N.7. 8535

ELECTRICIAN, Wireman, 1st class; lighting, power, 'phones; town or country. Full district rate.—8531, Electrical Review, 4, Ludgate Hill, London.

ELECTRICIAN, good all-round, a.c. or d.c., wants job. Go anywhere.—8525, Electrical Review, 4, Ludgate Hill, London.

ELECTRICIAN seeks job, all-round experience; town or country.—Durtnall, 138, Sydney Road, N.10. 8524

ELECTRICIAN (32), long experience of shop and house installations; also staff maintenance.—B.W., 39, Gladstone Street, S.E.1. 8540

ELECTRICIAN, charge or otherwise; power, light, heat, maintenance, plant work; good refs.—"Electrician," 389, High Street, North, Manor Park, E.12. 8534

ELECTRICIAN, charge or otherwise; lighting, power installations, motors, wiring, all systems; testing, maintenance, or contracting.—"Electrician," 12, Pine Grove, Maidstone. 8488

ELECTRICIAN wants work; used to all systems; can take charge or estimate. Willing to fill in time at anything.—8490, Electrical Review, 4, Ludgate Hill, London.

ELECTRICIAN, plant, maintenance, wiring, screwed barrel, oil engines, batteries, &c.; town or country.—C., 9, Ripplevale Grove, N.1. 8464

ELECTRICIAN (young) requires situation with electrical firm; previous experience in lighting and power installation, maintenance and wireless work.—Mitchell, 35, Stonehill Road, Chiswick, W.4. 8460

ELECTRICIAN Improver, age 22, reliable and energetic, desires berth; maintenance preferred.—8459, Electrical Review, 4, Ludgate Hill, London.

ENGINEER-Electrician, plant maintenance, wiring, steam, gas or oil engines; batteries.—Brunt, Brookmans, Hatfield. 8585

ENGINEER-in-Charge, 17 years' experience, desires position in works, public building, or generating station; accustomed to steam and i.c. plants, electric and hydraulic lifts, refrigeration, &c.; excellent references.—8576, Electrical Review, 4, Ludgate Hill, London.

EXPERIENCED Stoker requires situation; hand or mechanical.—8570, Electrical Review, 4, Ludgate Hill, London.

EX-WIRELESS Operator requires position ashore; good knowledge electrical work; thoroughly reliable; good references.—8505, Electrical Review, 4, Ludgate Hill, London

FIRST-Class Construction and Maintenance Telephone Engineer requires permanent position at home or abroad.—8504, Electrical Review, 4, Ludgate Hill, London.

FOREMAN Inspector, motors, wiring, &c.; supply company experience; good estimator; capable; take charge; private plant; good references.—8445, Electrical Review, 4, Ludgate Hill, London.

FOREMAN, Production, a.c., d.c. motors, stampings, assembling, tools, machining operations (otherwise firms wishing to start making stampings). Wide experience.—8552, Electrical Review, 4, Ludgate Hill, London.

INSTRUMENT Maker (1st class) requires situation; 24 years' experience; capable of taking charge.—T.B., 52, Hazeldean Road, Harlesden, N.W.10. 8595

SITUATIONS WANTED.—*Continued.*

MANAGER of Electrical Business desires similar position abroad. Fully acquainted with advertising, sales, and general supervision of installation and plant work.—8558, Electrical Review, 4, Ludgate Hill, London.

REPRESENTATION of good firm required by qualified Electrical and Mechanical Engineer, with connection in S.W. London area, Surrey and part Hampshire.—Salary and or expenses and commission.—8241, Electrical Review, 4, Ludgate Hill, London.

SALES Engineer, A.M.I.E.E., with large and valuable personal connection with Government offices, supply engineers, and leading firms. Heavy records of turnover. Wants Managership or to represent manufacturers in London and Home Counties. Highest credentials, wide practical, technical, and commercial experience.—8455, Electrical Review, 4, Ludgate Hill, London.

STOREKEEPER, Counter Salesman, fully conversant wholesale electrical and wireless trade packing and despatching; excellent references; salary, 50s.—James, 58, Fortess Road, N.W.5. 8586

TO Cable Makers, Wire Manufacturers, &c.—Position required by advertiser, having expert knowledge and practice of wiredrawing and preparation for same, including the layout and erection of plant, in all details, for modern methods of production.—8315, Electrical Review, 4, Ludgate Hill, London.

WANTED, position as Mains or Assistant Mains Engineer, or Clerk of Works; experienced high and low tension, overhead and underground transmission, distribution, and substation work; ability, tact, initiative. Present employed municipal body.—Write 8580, Electrical Review, 4, Ludgate Hill, London.

WIREMAN, good hand, thoroughly reliable.—Hearn, 19, Bryantwood Road, London, N.7. 8452

WIREMAN, good all-round, now disengaged; references.—"Electrician," 28, Sheen Grove, N.1. 8533

WORKING Engineer requires post, small supply undertaking or factory, conversant with generating plant, switchboards, batteries, overhead and underground distribution, wiring installations.—8573, Electrical Review, 4, Ludgate Hill, London.

YOUNG Man (23), with examinations in mechanical and electrical engineering and mechanical technology, desires post as Junior Draughtsman; willing to accept small salary to start.—A. Wickham, 106a, Broughton Road, Fulham. 8557

YOUNG Man (17) desires change of occupation, requires work with engines generating electricity; no experience.—Hayles, Rossway, Berkhamsted, Herts. 8518

YOUNG Man (23), Fitter Turner Improver, used to plant construction, machine shop, electric knowledge; references.—Write Brass, West View, Evenwood, near Bishop Auckland, Co. Durham. 8483

A Selection from the Miscellaneous Section of our Stock.

STEAM ENGINE SETS.

150/150 lb. Compound Non-condensing.

ONE Belliss 85 kW, 220 volts, d.c., 520 r.p.m.
One Howden 120 kW, 220 volts, d.c., 355 r.p.m.

PETROL-PARAFFIN GENERATING SETS.

Large number of sets from 10 kW to 50 kW, all voltages from 80 to 500.

A.C. SWITCHGEAR.

One B.T.-H. 8-panel, black enamelled slate, 3-phase, 50 per., 440-volt board, six 3-pole, 200 amps., and two 3-pole, 500 amps., oil-immersed breakers (ammeter, power factor indicator and integrating wattmeter each panel), busbars, &c., complete.

Two B.T.-H. ironclad, drawout, truck type H.T. (3,300 volts) cubicles, each with 200-amp. O.I. circuit breaker, isolating switches, &c.

Five B.T.-H. type O.D.I. 60-amp. circuit breakers.

Two Ellison triple-pole ironclad, oil-immersed circuit breakers, 300 amp. capacity, floor mounting, complete with three overload releases, time lags and no-volt release.

D.C. BROOKHIRST PILLARS.

A large range of pillar type d.c. motor control panels for all voltages and any size up to 100 h.p.

SWITCHBOARD FITTINGS.

Circuit breakers, knife switches, instruments, &c., &c., in large quantities and new condition.

MAGNET.

One 36-in. diameter circular lifting magnet, reconstructed by Allen West & Co., Ltd., 220 volts, 25 amperes, complete with chain and lifting shackle.

TRANSFORMERS, 3-PH., 50 PERIODS, OIL IMMERSED, SELF-COOLING.

One 1,000 kVA, 3,300/440 volts, B.E.T. Co.

Two 1,000 kVA, 6,600/440 volts, Ferranti.

PUMPS.

One British Electric Plant, 200 g.p.m., 150-ft. head pump, with direct-coupled 16-h.p. d.c. motor.

One Mather & Platt, 115 g.p.m., 450-ft. head turbo pump, direct-coupled to 25/30-h.p., 220-volt d.c. motor.

REDUCTION GEARS.

Fifteen reduction gears for electric motor drives, worm and spur wheel type, all oil-immersed, for powers from 1 h.p. to 100 h.p., reductions up to 30 to 1.

STEAM, GAS AND WATER VALVES.

Several hundred brand new Hopkinson Valves at less than half makers' price. Priced catalogue on request.

ALTERNATOR.

One 200-kVA, 3-phase, 50-period, 500-volt rotating field Bruce Peebles alternator, with three pedestal bearings, bedplate, rope pulley, and direct-coupled exciter.

HIGH TENSION MOTORS.

One 65-h.p., 1,450-rev., 3-phase, 50-period, 2,750-volt slip ring English Electric motor.

One 430-h.p., 500-rev., 3-phase, 50-period, 3,300-volt slip ring G.E.C. motor.

The above represents only a small selection of our stock.
Please send us your enquiries.

FOR SALE.—*Continued.*

FOR SALE.

ONE Marine Type Cylindrical Boiler, 13 ft. dia. by 11 ft. long, 3 in. tubes, 1,800 sq. ft. heating surface, 220 lb. w.p., 2 furnaces, complete with steam mountings.

Two Brush-Ljungstrom Turbo-Alternators, each of 625-kW capacity, 3,600 r.p.m., 650 volts, 60 cycles, suitable for 180 lb. per sq. in. steam pressure, complete with under-slung Condensers, each of 1,150 sq. ft. cooling surface. Generators fitted with self-contained exciters, lubricating oil fittings, and usual equipment.

Two Induction, 3-phase, 650-volt Motors, each of 785 b.h.p., 714 r.p.m., built by Brush Electrical Engineering Co., Loughboro'.

One Helical Reduction Gear, comprising 1 wheel and 2 pinions, capable of transmitting 1,570 b.h.p. total with reduction ratio of 714-76 r.p.m., complete with casing and usual fittings. Gearing manufactured by Power Plant Company.

Above plant, together with miscellaneous starters, pumps, &c., removed from S.S. *Wulsty Castle*, can be inspected at Naval Construction Works, Dalmuir, and offers for same should be sent to Messrs. William Beardmore & Co., Limited, Engine Department, Dalmuir. 3826

COUNTY BOROUGH OF PRESTON.

Electricity Department.

THE Electricity Committee invites tenders for the purchase and removal of the following Surplus Plant now lying at the Ribble Power Station and the Crown Street Sub-station, Preston.

ROTARY CONVERTORS.

One 500-kW Rotary Convertor by Metropolitan Vickers Co., Ltd., 6-phase, 50 periods, 450/480 volts, 1,100/1040 amperes, 750 r.p.m., complete with a.c. Booster, Exciter, and Starting Motor, also Exciter Rheostats.

TRANSFORMERS.

One 1,250-kVA, 3-phase, 50 periods, 6,600/280 volts, delta star Transformer group of 3 single-phase Transformers, h.t. tappings for 6,400 and 6,200 volts, complete with oil. Makers, Metropolitan Vickers Co.

The plant is in good order and has been replaced by larger units.

Tenders to be addressed to the Borough Electrical Engineer, 118, Fishergate, Preston. 3845

FOR SALE.

TWO Carels 320-h.p., 4-cylinder Diesel Engines, 175 r.p.m., coupled to—

Two Dick, Kerr 200-kW, 500/550-V, d.c. Generators, also switchboard, instruments, cooling water and fuel oil tanks, and Premier wooden natural draught open type water cooler.

One Reversible Booster, by Lancashire Dynamo Company, 0/150 V, 220/460 amp., 770 r.p.m., with switchboard.

One 10-ton Overhead Travelling Crane, by Herbert Morris and Bastard, Ltd.

Above plant all in good condition, comprising the complete equipment of a small 500-V, d.c. generating station, may be inspected by arrangement.

Apply Yorkshire (West Riding) Electric Tramways Co., Ltd., Belle Isle, Wakefield. 3309

FOR SALE.—*Continued.*

UNIQUE OFFER OF LIGHTING AND POWER PLANT,

All in first-class condition and ready for immediate service.

THE Plant consists of the following Machinery, which has only recently been taken out of commission.

PLANT NO. 1.

One Water-cooled, 125-h.p. Fielding & Platt Suction Gas Engine, fitted with graduated governor, water-cooled exhaust valve, magneto ignition, complete with gas cocks, exhaust pipes, air pipes, silencers, circulating pump, gas bag for town's gas, three 1,000-gall. circular cooling tanks, one 5-ft. driving pulley, and complete set of spares, comprising piston rings, springs, valves, cam shaft, gears, &c.

One 100-h.p. Fielding & Platt Suction Gas Governor Plant, complete with coke and wood-wool scrubbers, pipe work, and water seal.

One 100-h.p., 460-volt, 540 revs., d.c. Crompton Generator, complete with slide rails, open type, shunt wound, 4 main poles, 4 interpoles. Oil ring bearings with overhung pulley for belt drive. Diameter of pulley 20 in. Width 20 in. Main driving belt for the above set, 60 ft. by 1 ft. 6 in.

One Wells Oil Separator.

One 10-in. belt-driven Fan for blowing fire.

PLANT NO. 2.

One Water-cooled, 230-h.p. National Twin Cylinder Suction Gas Engine, fitted with hit and miss governor, magneto ignition, complete with gas cocks, exhaust pipes, air pipes, silencers, circulating pumps, gas bag, and complete set of spares, comprising piston rings, valves, &c.

One Smith's Patent Water Cooler.

One 200-h.p. Dowson & Mason Suction Gas Plant, complete with coke and wood-wool scrubbers, pipe work, and water seal.

One 134 kilowatt, 460 volt, 450 revs. Crompton Generating Set, complete with slide rails, open type, shunt wound, 6 main poles, 6 interpoles, with three oil ring bearings. Diameter of pulley 33 in. Width 26 in.

One main Driving Belt, 65 ft. by 20 in.

One Wells Oil Separator.

One Sturtevant Belt-driven Blower.

ADDITIONAL PLANT.

One 4-in. Kennedy Water Meter.

Two Herbert Morris 5-ton Lifting Blocks.

Two 36-in. Belt-driven Exhaust Fans.

One Tubular Steam Boiler, approx. 9 ft. long by 4 ft. diameter, by the National Gas Engine Co.

Three Oil Tanks.

The whole plant is being offered for sale by Private Treaty at very reasonable prices. It is situated a short distance out of London and can be viewed at any time by appointment. In the first instance apply 3876, Electrical Review, 4, Ludgate Hill, London.

STEAM GENERATING SETS.

500 KW, 3,000/3/50, Belliss-E.C.C.

GENERATOR, Crompton, 220 V, 150 A., 650 r.p.m., shunt, rails and pulley, unused; £55. 1 h.p., 400 V, 3-phase, 50 periods, 930 r.p.m., Parkinson, with no-volt starter, new; £6. 4½ h.p., 1,300 r.p.m., shunt, 460 V, Higgs, with rails and pulley, perfect; £9 5s. 7½ h.p., 1,000 r.p.m., shunt, Dick, Kerr, double automatic starter, 500 V; £9. 3 h.p., 230 V, shunt, 1,550 r.p.m., Higgs, with starter, as new; £9. 2 h.p., 460 V, shunt, 1,300 r.p.m., G.E.C., with starter; £7. 6 h.p., 230 V, shunt, 2,800 r.p.m., Phœnix; £9. Westinghouse Oil-immersed Star-delta Starters, with no-volt releases up to 20 h.p., 400 V, 50 periods; £7.—Foxton, 9, Scarisbrick Avenue, Litherland, Liverpool. 8572

Advertisements are inserted under this heading at 1s. 9d. per line.

A BIG selection of Oil and Steam Generating Plant, Motors, Dynamos, Pumps, and equipment of every description.—F. Winkworth & Co., 82, Victoria Street, S.W.1. Victoria 1770 (two lines). 3927

ALTERNATING and Direct Current Electric Motors, ¼ to 100 h.p. First-class machines, with full guarantee. Hire or sale.—Electro-Generator Co., 5, Uxbridge Road, Shepherds Bush, W.12. Riverside 0488. 8545

AMPS., Milliamps., Microamps., Volts, Millivolts, Ohms and Megohms, all accurately measured by the 55 range "Ultra Onemeter." A wonderful moving coil pocket precision fault locater.—Leslie Dixon Instruments, 218, Upper Thames Street, E.C.4. 745

CARBONS, Searchlights, sale or hire, Mirrors, Lenses, half price.—The London Electric Firm, Croydon. 19

CHARGING Dynamos, 30-50-75-100 volts, 10-15 amps., leading makers, guaranteed.—Thompson & Co., 39-43, London Street, Greenwich. 3900

CROMPTON Motor Generator, 60 amps., 100 volts, 1,100 r.p.m., motor side 9½ h.p., 400 volts, interpole, protected type machines, with complete two-panel switchboard, all in splendid order.—Oldfield Engineering Co., Ltd., Hampson Street, Salford. 3910

CRUDE Oil Engines, 70, 50 and 40 h.p.—Harry H. Gardam and Co., Limited, Staines. 'Phone 98. 3631

DE Laval Turbine, coupled direct 75-volt, 25-amp. generator; condition new.—Thompson & Co., 39-43, London Street, Greenwich. 3898

DYNAMOS, 25 V, 50 V, 70 V, 20 A, Crompton. £6 each.—White, 47a, Pomeroy Street, New Cross. 3615

ELECTRIC Motors, 1/40 to 50 h.p. New and Secondhand. State requirements.—Enterprise, 11, Grape Street, W.C.2. 3832

ELECTRIC Power Cable, from .07 to .15 three core, 37/12 single, 5,000 ft., Megger tested. Also boxes and various electrical accessories.—Hubert Jones, King Street, Bury. 3882

ELECTRIC Turbine Pump, Holden & Brook-Phœnix, 4-in. delivery, 150-ft. head, 300 g.p.m., 220 volts, d.c. Sulzer-Phœnix low lift Turbine Pump, 220 volts, d.c., 8-in. delivery, 70-ft. head.—Harry H. Gardam & Co., Ltd., Staines. 'Phone 98. 3735

EPALTRICAL.—Large number of good Second-hand, 460-volt Motors for Sale at low price.—E. P. Allam & Co., Ltd., 107, Gray's Inn Road, W.C.1. Holborn 5833. "Epaltrical," Holb., London. 3709

FIVE 7 h.p., E.C.C., 220 volt, d.c. Machines, 400 r.p.m.—Harry H. Gardam & Co., Limited, Staines. 'Phone 98. 3630

FOR Sale, large number direct-coupled Generating Sets for oil and gas, including 3/4-kW Aster, 25/37 volt; 3½-kW Lister, 110 V; 4-kW Rational, 100/145 V; 6-kW Belliss, 50/75 V; 10-kW Parsons, 220 V; 18-kW Dorman, 500 V; 22-kW Crossley, 220 V; 30-kW Aster, 220 V; 50-kW Daimler, 220 V; and many others.—Fyfe, Wilson & Co., Ltd., 31, Budge Row, London, E.C.4. 3919

FOR immediate Disposal: Three A.E.G. Butt Welding Machines, type S.T.15, amps. 75/4810, 200 volt, 50 cycles, treadle operated clamps. What offers?—Dunlop Rim and Wheel Co., Ltd., Coventry. 3904

FOR Sale, 8 Motors and Starters, 440 volts, d.c., in good working order, one 1½ h.p., one 7 h.p., three 10 h.p., one 15 h.p., one 20 h.p., one 30 h.p.—Seen at Hartley, Sons & Co., Engineers, Etruria, Stoke-on-Trent. 3887

FUSEBOARDS, Teak, 2-way 4s. 3d., 3-way 6s. 4d., 4-way 8s. 6d. List free.—Enterprise, 11, Grape Street, W.C.2. 3831

GARDNER Paraffin Set, 14 kW, 110 volts; seen running. £75 cash.—3926, Electrical Review, 4, Ludgate Hill, London.

LAMPS.—In original packings, 3,500 "Osram," 210 V, 30 W; M.F.'s. 13,500 "Mazda," 210 V, 30 W. M.F.'s. Offers required for the whole, or case lots. Samples submitted.—3938, Electrical Review, 4, Ludgate Hill, London.

FOR SALE.—*Continued.*

LIGHTING Plants: 2¾-, 3½- and 4½-kW Austin and Standard Petrol-Electric (direct coupled) Generating Sets, from £25 each.—Inspect at Burleighs, 45, Hornsey Road, London, N. 'Phone: North 1675. 8

LIGHTING Plants, petrol-paraffin, Petter-Verity, 50/70 V, 18 A, new. £47 10s. Guaranteed.—White, 47a, Pomeroy Street, New Cross. 3616

MOTORS and Dynamos in stock. Condition guaranteed.—Drummond & Co., Middlesbrough. 6

MOTOR and Worm Gear Set, 50 b.h.p., 460 volts, 825/985 r.p.m., compound, interpole, Electromotors make, 19 to 1 reduction, on c.i. base, and complete with control panel.—Oldfield Engineering Co., Ltd., Hampson Street, Salford. 3911

NAMEPLATES in Metal, Ivorine, &c. Bronze and Brass Doorplates.—Stilwell & Sons, 7, Jordan Well, Coventry. 14

NEARLY new 500-kW Browett, Lindley Steam Generating Set, direct-coupled to 3-phase alternator, 440 volts, 50 periods, with exciter. Low price.—Williams, 37, Queen Victoria Street, London. 3928

NEARLY new 40-kW Motor-Generator, d.c. motor, 400 volts, 120 amps., direct-coupled to d.c. generator, 200 volts, 200 amps.; immediate delivery.—Williams, 37, Queen Victoria Street, London. 3929

NEW 37/.103 V.I.R. Braided Cable; also .093, .083, and .072. Extra cheap. Best English makes.—Edwardes Bros., 20, Blackfriars Road, London. 8592

POLES, 16 to 40 feet, for hire and sale, suitable for telegraph, transmission, wireless, scaffold, &c.—Sir William Burnett & Co., Ltd., Nelson Wharf, Milwall, E.14. 4

SEVERAL 240- and 480-volt, d.c. Motors, complete with pulleys, starter and rails, 1 to 25 h.p., from 30s. per h.p.—Norvall Bros., 19, Albion Grove, N.16. 8562

SPENCER-Bonecourt Gas-fired Boiler, suitable for supplying steam plant for moulded insulation. Low price for immediate sale.—Write Fisher, 16, Argyle Road, Ilford. 8567

STEAM-Electric Plants.—75 kW, 25 kW, 17 kW, 220 volts, d.c.; recent make.—3925, Electrical Review, 4, Ludgate Hill, London.

SUNK Switch Boxes, 1-way 1s. 11d., 2-way 3s. 6d., 3-way 4s. 6d., 4-way 5s. 6d. List free.—Enterprise, 11, Grape Street, W.C.2. 3830

TELEPHONES.—Owing to alteration of telephone system to automatic, manufacturer has large quantity of second-hand Wall and Table Magneto Telephones for sale at very low prices. All apparatus guaranteed in good working order.—8442, Electrical Review, 4, Ludgate Hill, London.

THREE 75-kW, 415/440-V, 3-ph., 50-period Steam Electric Generating Sets for disposal, with Berry Transformers to 550 volts. Can be seen running.—Harry H. Gardam & Co., Limited, Staines. 'Phone 98. 3734

THREE Weir Boiler Feed Pumps, 14 in. by 10 in. by 18 in., 12 in. by 9 in. by 21 in.; 8 in. by 6 in. by 12 in.—Harry H. Gardam & Co., Limited, Staines. 'Phone 98. 3017

THREE New "Delco" Automatic Lighting Plants (32 volts), complete with 160 amp. storage batteries. £55 each.—Inspect, Burleigh, 45, Hornsey Road, London, N.7. 3820

TWO 300-yard lengths, .23, three-core, e.h.t., paper-insulated, lead-covered, wire Armoured Cable, ex Wembley Exhibition. Price 15s. per yard.—R. F. Winder, Ltd., Belgrave Electrical Works, Leeds. Telegrams: "Contact Leeds." 'Phone: 20461 (2 lines). 3871

TWO E.C.C., 35-h.p. Motors, 200 volts, single-phase, 100 period, 1,460 r.p.m., slip ring, perfect condition.—Thompson, 39-43, London Street, Greenwich, S.E.10. 3899

WASTE Heat Boiler by Cochran, 17 ft. 6 in. by 7 ft., new 1919. 100 lb. w.p. Also Standard Cochran Multitubular Boiler, 14 ft. by 7 ft., 100 lb. w.p.—Harry H. Gardam and Co., Limited, Staines. 'Phone 98. 3633

WATTS, Hardy & Company (1920), Ltd., Clarendon House, Newcastle-on-Tyne, have for Sale the following Second-hand Cable in excellent condition:—200 yards .25 sq. in., 37/.093 class, 702 single core, double wire Armoured Electric Cable; 600 yards .10 sq. in., 19/.083 class, 713 two core, single wire Armoured Electric Cable; 1,200 yards jute covered, S.W.A., two core, 3/20 Telephone Cable.—For price apply as above. 3800

WORM Gears, Wallwork, 20 h.p., 20:1 and 13½:1.—Greenhalgh Bros., Atherton. 3729

3-BEARING Crompton Dynamo, 75 kW, 480 volts, d.c., 950 r.p.m., belt pulley, 3 slide rails, with slip rings and transformer for 16 amp., 230-volt lighting circuit if required.—Oldfield Engineering Co., Ltd., Hampson Street, Salford. 3912

28-H.P. Siemens Slip-ring Motor for Sale, 730 revs., suitable for 3-phase, 50 cycles, 400/440 volts, with Ellison starter and circuit breaker.—Thomas Mitchell & Sons, Ltd., Bolton. 3811

FOR SALE.—*Continued.*

35-H.P., 440-volt, d.c., 760 r.p.m. Motor, with slide rails, pulley, starter, and main switch.—Harry H. Gardam and Co., Limited, Staines. 'Phone 98. 3632

50-H.P., 415-volt, 3-phase, 50-cycle, Slip-ring Motor, 720 r.p.m., with starting gear; first-class condition. Immediate disposal.—3851, Electrical Review, 4, Ludgate Hill, London.

50 VOLT, 10 amp. Crompton. Price £5 10s.—Thompson and Co., 39-43, London Street, Greenwich, S.E.10. 3901

80-VOLT, 30-watt Osram M.F. Lamps, B.C. or E.S., clear or coloured. 60 per cent. off list. And other voltages.—Edwardes Bros., 20, Blackfriars Road, London. 8591

160-KW, 500-volt, 3-phase, 50-cycle Alternator, direct to Belliss compound engine. Cheap for quick sale.—James Grant & Co., 484, Pollokshaws Road, Glasgow, S.1. 3815

200-H.P., 400/440-V, 3-ph., 50-per., 416 rev., E.C.C. Motors.—Greenhalgh Bros., Atherton. 891

500-H.P., 3,000/3,500-V, 3-ph., 50-per., 291-rev., slip ring, B.T.-H. Motor.—Greenhalgh Bros., Atherton. 892

ARTICLES WANTED.

CORRECT
Illumination of Shop Windows.

Install

BENJAMIN
Shop Window Reflectors

¶ A well-lighted window really forms one of the most economical and effective advertisements and has been aptly described as a "silent salesman." Efficient window lighting depends entirely on the use of scientifically designed reflectors, selected according to the dimensions of the space to be illuminated.

We shall be pleased to make recommendations—without obligation—which will ensure efficient shop window lighting.

FULL DETAILS OF OUR SHOP WINDOW LIGHTING EQUIPMENT WILL BE SENT ON REQUEST.

At Home

HENLEY

UNIT PILLARS

and Overseas

Walmgate Bar, York.

Entrance to the City of York in mediæval times was gained by four chief and one less important bar. Walmgate Bar is the only one which still retains its barbican. This was badly damaged in the 1644 siege and was repaired with the stones of St. Nicholas Church which stood about half a mile away. The Distribution Pillar shown is, of course, a Henley Unit Pillar.

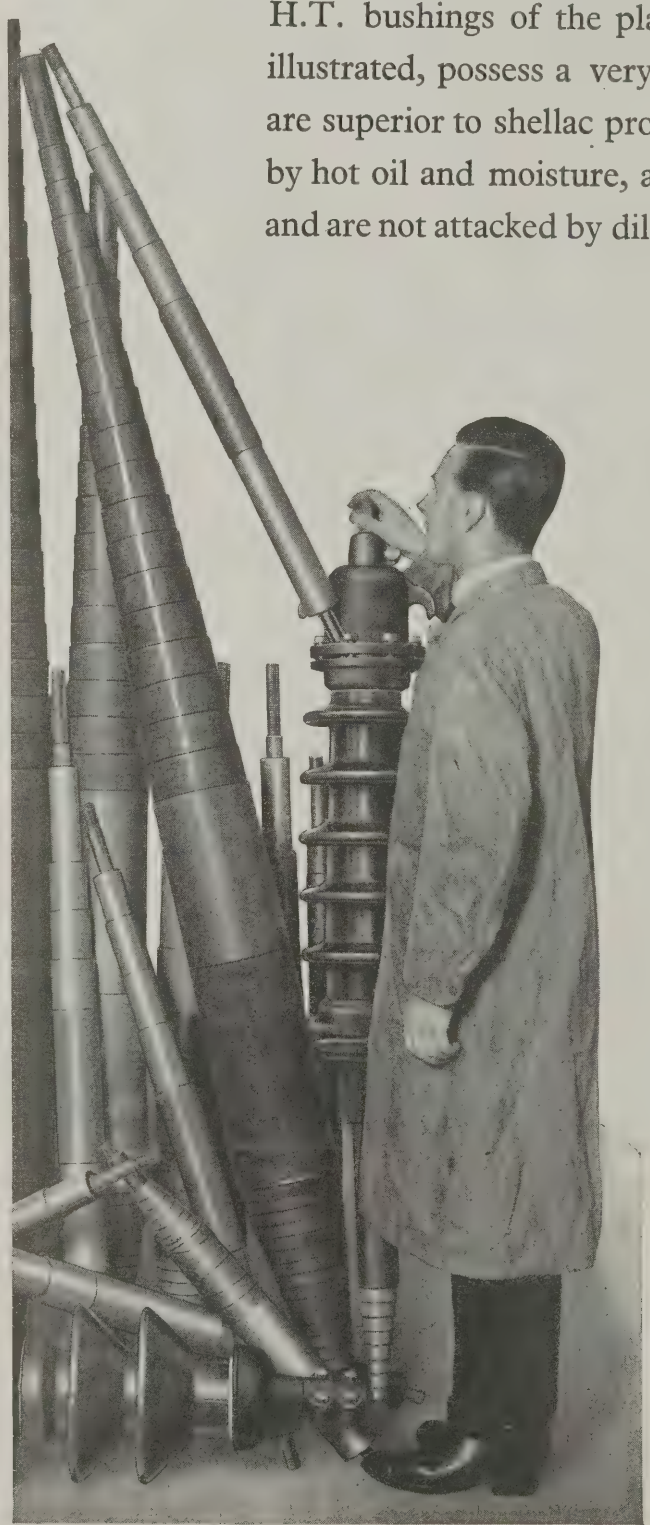
At Home

HENLEY

UNIT PILLARS

and Overseas



It's a far cry from York to Lucknow but Henley Unit Pillars can be found practically anywhere nowadays. The historical interest of Lucknow lies in the famous Siege of 1857. Lucknow was partially relieved by Havelock and Outram, but it was not until October, four months after the commencement of the Siege, that Sir Colin Campbell took possession of the place.
Our Contract for the supply and installation of a D.C. distributing network at Lucknow Cantonments included several Henley Unit Pillars.

Advt. of W. T. Henley's Telegraph Works Company Ltd. Holborn Viaduct, London E.C.1

HIGH TENSION INSULATION

The reliability of electrical apparatus designed for operating on modern high voltages, depends almost entirely upon the quality of the insulation used.

"Formapex" Synthetic resin treated papers, as used for H.T. bushings of the plain and condenser types such as illustrated, possess a very high electrical strength. They are superior to shellac products, in that they are unaffected by hot oil and moisture, are inert, insoluble, and infusible and are not attacked by dilute acids, petrol, naptha, or ozone.

"FORMAPEX" PAPERS AND CLOTHS ARE ALSO MADE UP INTO TUBES, (ROUND OR RECTANGULAR), AND "MIOCARTA" BOARDS FOR H.T., GENERAL USE, OR FOR PUNCHINGS.

"FORMAPEX" IS ALSO SUPPLIED IN THE FORM OF VARNISH, OR AS POWDER FOR MOULDINGS.

'Phone: Victoria 4144. London, S.W.1.

NINE POINTS OF OUR LAW.

1. The S.T.E. stands for the improvement in the status and economic position of the engineering profession, by the proper organisation of engineers on a professional basis.

2. It stands for the independence of the profession as regards its relationships with employers and workpeople, holding firmly that all technical engineers should take up a third-party position in industry.

3. It stands for the advancement of British industry by increasing the efficiency of the engineering profession, and by organising the study of industrial and economic problems from the special point of view of management, not from that of either capital or labour.

4. It stands for the establishment of machinery that will enable the management grades in industry to take their proper place in its councils side by side on a footing of equality with employers and workpeople.

5. It stands for constitutional methods of redressing difficulties in industrial relationships, believing that aggressive methods injure all interests and provide no solution to any problem.

6. It stands for economic salaries and reasonable working conditions for those who belong to the engineering profession, and by means of its collected data it has enabled many of its members to secure improved salaries.

7. It stands for a national scheme of superannuation for staff workers in the engineering industry and for insurance against unemployment, having in operation an unemployment insurance scheme for its own members.

8. It stands for moderate subscription charges to its members, its subscription rates ranging from ten shilling to two pounds a year, according to age.

9. Finally, it stands for strengthening its membership so that it will be able to give full effect to its programme, and it will send free detail than can be done here, its aims, organisation, and policy.

ELECTRICAL ACCIDENTS and THEIR PREVENTION:

A Pamphlet dealing with the Causes and Prevention of Accidents due to Electricity, based on H.M. Factory Inspectors' Reports.

No one employed in Factories, Workshops, Power Stations, Railways, or in any capacity where there is danger of electric shock which might prove fatal should be without one.

Specific instances are given of injuries due to inadvertence, familiarity, handling by unskilled persons, unusual types of accidents, &c.

All employers utilising electrical power should provide their employees with these leaflets.

BRITISH ELECTRIC TRACTION CO. LTD.

THE thirty-first ordinary general meeting of the British Electric Traction Co., Ltd., was held on Tuesday, June 21st, at the Holborn Restaurant, W.C.

Mr. J. S. AUSTEN, who presided, said that the results for the year under review were slightly better than those of the previous year, and were a very great deal better than he at one time expected. He knew that there would be large losses in some of their undertakings which operated in mining district, and those losses had been fully realised. He certainly did not expect the revenue from other investments to make good those losses, but the wonderful recuperative power of the company had once more asserted itself, and the losses referred to had been more than made good. Beyond the strike there had been no event of vital importance. From their point of view the important event had been the completion by one of their subsidiary companies of the power station at Stourport at a cost of £800,000, lately opened by the Prime Minister.

As to the bonus scheme which had been very much before them recently, no change whatever was made with regard to the 6 per cent. cumulative participating preference stock, the ordinary stock now became an 8 per cent. non-cumulative preferred ordinary stock, and the new deferred ordinary stock about to be created and distributed would take all that was left. He had only come across one misapprehension with regard to the scheme, and that concerned the preference stock. It seemed to have got into the minds of some stockholders that, in future, they were going to receive 8 per cent. on that stock whatever happened. The true fact was that they would get the cumulative dividend of 6 per cent., the extra 2 per cent. remaining contingent, as it did before, upon the balance after 8 per cent. had been paid on the new preferred ordinary stock.

The main object which the directors had had in mind in formulating that scheme had been to recover the stockholders' lost capital. Perhaps he ought not to use that expression "lost capital," but rather capital which had been written off. When a company wrote down its capital, it was usually upon the ground that capital had been lost and was not represented by available assets. What in practice happened was that in the first place the directors persuaded themselves that some capital had been lost, and then persuaded the shareholders to the same effect, and finally, by means of affidavits, persuaded a Chancery Judge. Those affidavits were strictly true, as all they did was to say that upon a valuation the capital was not fully represented. What they did not say was that with a little luck and good management that capital might very likely be regained. His contention was that in many cases the capital had not been lost, but that there had merely been depreciation, often temporary, in value. He himself was a director of five companies, of which the British Electric Traction was one, which had written down their capital, and in the four other cases those companies had not only regained all that they had lost, or was considered to be lost, but a very great deal more, and he thought the British Electric Traction Co. was now well on the way towards doing the same.

He knew that some stockholders felt that they had lost capital, and, therefore, the directors wanted to give them something that would not only remove that feeling, but would actually make good any real loss which might have been sustained. The present bonus of deferred ordinary stock was, he hoped, only a first instalment, and, if at the end of the current year they were able to pay a dividend of 10 per cent. or more, he would himself like to see that dividend paid not in cash, but in stock. He did not want that to frighten the stockholders, for, if £100 stock was worth £150 in the market—and he would like to see it at £200—it did not take much arithmetic to show that £10 in stock that was worth £15 or £20 was better than £10 in cash. Of course, the decision would be in the stockholders' hands, and he thought that all except a few greedy stockholders, who wanted both, would be quite satisfied to take stock.

The report and accounts were adopted, and a resolution passed approving the capitalisation of £132,626 7s., part of the undivided profits, and its distribution in fully-paid deferred ordinary shares among the holders of the 8 per cent. non-cumulative preferred ordinary stock. 3931

OFFICIAL NOTICES.

Latest time for receiving, 5 p.m. Tuesday.

HAZEL GROVE AND BRAMHALL URBAN DISTRICT COUNCIL.

Electricity Mains Extensions.

THE Hazel Grove and Bramhall Urban District Council are prepared to receive Tenders as follows:—

Contract No. 8.—2,800 yards of .06, three-phase, 6,600-volt Cables, including laying and accessories.

Copies of the specification and form of tender may be obtained on application to Mr. T. L. Miller, M.Inst.C.E., Consulting Engineer, 316, Royal Liver Building, Liverpool, on payment of one guinea, which will be returned on receipt of a *bona-fide* tender, and the return of the documents supplied.

The Council do not bind themselves to accept the lowest or any tender. Contractors will be required to pay the Trade Union rate of wages and observe the Trade Union number of hours in force.

Tenders addressed to me, and endorsed "Tender for Electricity Mains," should be sent so as to be received at these offices not later than 6 p.m. on Tuesday, the 28th June, 1927.

By Order,

Council Offices, Hazel Grove, nr. Stockport. June 8th, 1927.

R. A. KNIGHT, Clerk to the Council.

3814

BOROUGH OF NEWCASTLE-UNDER-LYME.

Electricity Supply Department.

THE Corporation invite tenders for the supply and erection complete at their Electricity Supply Station of a 350-kW Rotary Convertor, together with the necessary e.h.t. and l.t. switchgear.

Specification, form of tender, and any further information may be obtained from the undersigned. No tenders for sections of the plant only will be considered.

Sealed tenders, endorsed "Tender for Conversion Plant," to be received by the Town Clerk, J. Griffith, Esq., Ironmarket, Newcastle, Staffs., not later than noon on Monday, July 11th, 1927.

The Committee does not bind itself to accept the lowest or any tender.

A. J. C. DE RENZI
Borough Electrical Engineer.

Electricity Works, Newcastle, Staffs.

3893

SINGAPORE MUNICIPALITY.

St. James's Power Station—First Extension.

THE Municipal Commissioners of the Town of Singapore invite tenders for the supply, delivery, and erection in Singapore of

ONE 10,000-KW TURBO-ALTERNATOR AND CONDENSING PLANT.

Specifications may be obtained on and after Friday, the 24th inst., from Messrs. Preece, Cardew & Rider, 8, Queen Anne's Gate, Westminster, S.W.1, on payment of a deposit of £2 for each copy, which will be refunded on receipt of a *bona-fide* tender. Extra copies may be purchased at 10s. each.

Sealed tenders, in duplicate, endorsed "Singapore—Turbo-Alternator," are to be delivered to the Agents of the Singapore Municipality, Messrs. Peirce & Williams, 64, Victoria Street, Westminster, S.W.1, on or before noon on Monday, the 25th July, 1927.

The Municipal Commissioners do not undertake to accept the lowest or any tender.

Kingsmoor School, Glossop.

"The New Outlook" Co-Educational Boarding School on the Derbyshire Moorlands.

THE conversion of this fine mansion, the residence of the late Lord Howard, into a Boarding School, presented many problems of which not the least was that of the electric lighting.

It was essential that the fine carving and beautiful panelling, and the harmony of the interior decorations which is such a feature in this building, should be preserved.

Following the advice of their Consulting Engineer, Mr. H. C. Crews, M.I.E.E., of Manchester,

The Macintosh (Patented) WIRING SYSTEM

was installed by Messrs. Harrisons, Ltd., 84, Oxford Street, Manchester.

Although the wiring is all on the surface the neat walnut covering is so blended with the woodwork that it is unnoticed.

The founders of the school have expressed their complete satisfaction with the result and have permitted us to make this announcement.

It is just such contracts as these which reveal the possibilities of the Macintosh Wiring System.

Have you seen the booklet of the system?

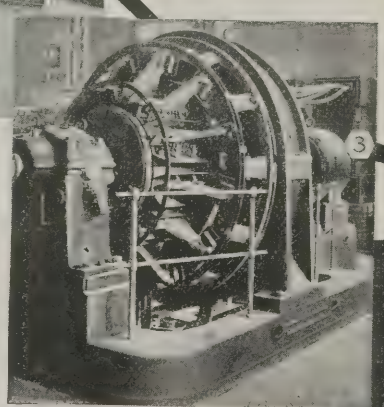
From the home of SWITCHES



THERE is no loophole for any but good, dependable switches to leave the Sperryn Works. Every one is rigidly watched through every stage of manufacture and undergoes a stringent final inspection before despatch. That's why Sperryn Switches maintain such a uniform high standard. That's why they're better Switches though they cost no more than nameless inferior brands. Specify "Sperryn Switches" in your next wiring contracts —there's a type for every purpose. Full information and prices from Dept. 12.

SPERRYN AND COMPANY
MOORSOM ST BIRMINGHAM

4,500 Kilowatts Unattended

The Balham Sub-station, illustrated here, is equipped with three "Metrovick" 1,500 kW. Rotary Converter Sets, together with "Metrovick" Transformers. H.T. and L.T. Switchgear and special control apparatus by which it operates entirely without attendance.

Power is taken at 11,000 volts, 3-phase, 50 periods, and converted to direct current at 600 volts for track operation.

It is the largest unattended sub-station in the British Isles.

"Metrovick" automatic converter sub-stations are in successful operation in all parts of the world.

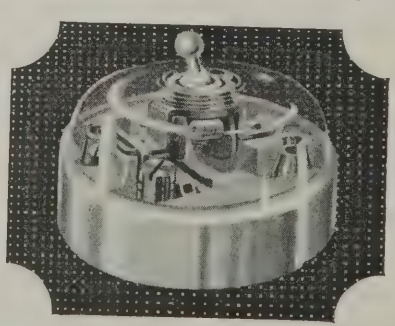
The Fables of Æsop and the Switches and Accessories of Wandsworth.



The Wolf and the Goat.

A Wolf caught sight of a Goat browsing above him on the scanty herbage that grew on the top of a steep rock, and being unable to get at her, tried to induce her to come lower down. "You are risking your life up there, Madame, indeed you are," he called out, "pray take my advice and come down here where you will find plenty of better food." The Goat turned a knowing eye upon him. "It's little you care where I get good grass or bad," said she: "What you want is to eat me."

It's little some care whether you get good Switches or bad. Much inducement is put before you—both as to a supposedly superior quality and tempting price. But mark well the value a WANDSWORTH Switch gives you. Before you succumb to the blandishments of others make certain of your appreciation of the sincerity in manufacture you now receive.

1927

ıe 21st Anniversary of

LANCASHIRE

;all Bearing Motors

ANOTHER instance of the L.D.M. anticipating future motor standards. The first *LANCASHIRE* motor to be equipped with ball bearings was made in 1906, identifying the L.D.M. as one of the pioneers in ball bearing motors.

The many advantages of this development in A.C. motor construction was widely recognised; it has become standard practice in Great Britain, and now motor makers in U.S.A. are following suit.

Since these pioneer days the L.D.M. have been called upon to design ball and roller bearing motors for every industrial drive, and, as a result of this long experience, there is no problem of electric drive, no matter how arduous the duties, but that the L.D.M. can furnish a satisfactory solution, and particularly so since the advent of the

New Effects in Bakelite

The Perfect example of Bakelite Moulding illustrated is one of the specialised lines of S. & S. M. Ltd. It is especially suited for use in rooms which are panelled, being made in realistic colours representing Walnut, Oak, or any panelling with which the room may be decorated. It is also made to blend perfectly with any colour scheme.

S. & S. M. pride themselves on being specialists in every type of Bakelite Moulding. Reliability, Permanence, Finish, and Perfection in every detail are the results attained by S. & S. M. in all their products. All these points, so necessary in every product, are coupled with a service to clients which is absolutely unrivalled. Send for an attractive brochure which describes how S. & S. M. can render you invaluable assistance in all questions relating to Bakelite Mouldings.

All enquiries dealt with by return of post.

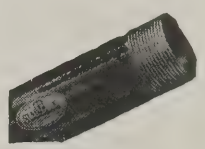
POPULAR with the consultant the contractor, and the man who does the job,

The NEW SIMPLEX SWITCH-GEAR is now firmly established.

Technical soundness, competitive prices and ease of wiring, are but three of many "reasons why."

Full details of the whole range are contained in **Folder 1128a** (gladly sent on request).

You may forget SIMPLEX



——when it is installed. No other wiring system gives such little trouble, or costs less in maintenance expenses. There is a SIMPLEX way of wiring for every kind of installation, from the lightest to the heaviest—from the maisonette to the coal mine, from the cinema to the cathedral. Whatever or wherever it be,

Put in Simplex, and forget it!

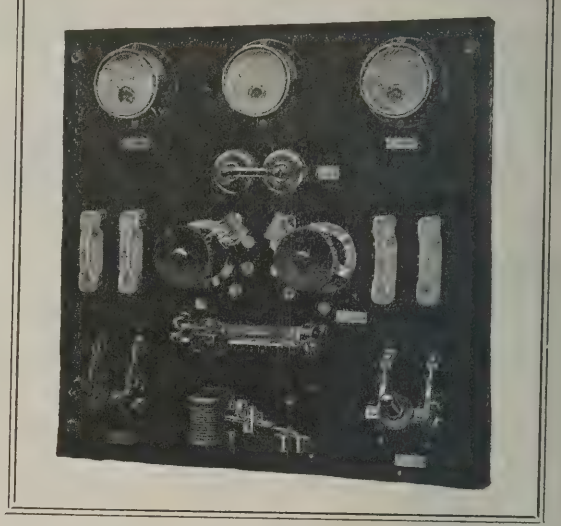
Keep down erection costs

Tucker Lampholders

Labour cost is one of the most flexible items in the electrical installation contract, and in consequence, the one where nearly all losses are incurred.

Tucker Lampholders coming to you perfect in every component, are quickly taken apart, and go together again smoothly, without trouble, the first time.

The practical man will be the first to appreciate what this means, especially on a large contract, and will need no further demonstration in favour of their use.



May we send further details?

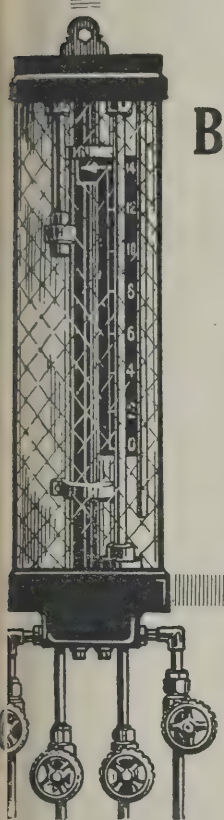
The following are extracts from scores of unsolicited testimonials we have lately received: —

NOTTINGHAM

"March, 1927. I wish to express my appreciation of the prompt delivery and attention you have given to the recent orders I have placed with you, for I consider it is service like yours that is greatly needed in business to-day, especially at the present time, when firms have to order just as they require, owing to the state of trade."

GLASGOW

"April, 1927. We have received the consignment against our order No.— and thank you for your prompt attention. We are perfectly satisfied with your lamps. It is a great pity that we have only just commenced dealing with you after a most disastrous experience last season."



BIRMINGHAM

"May, 1927. We send you herewith our cheque in settlement of the recent consignment of pipless lamps. They are a delightful production."

ESTABLISHED IN PUBLIC SERVICE

A TUDOR Installation at Sydney, N.S.W., comprising 300 cells supplying 6860 amperes for one hour.

No Passengers.

Every cell in an accumulator battery must "pull its weight"—there is no room for passengers.

In Tudor Batteries we ***ensure*** consistency of results; nothing is left to chance, nothing is skimped.

Thirty years ago we set out to work on these lines, and as we add year by year to our experience in accumulator design, so do we become more and more convinced that it is the only sound policy.

It is on this merit of consistent reliability that the Tudor Battery has become so firmly Established in Public Service.

It is on this merit that we put forward claims to your consideration when you are contracting for an accumulator battery, large or small.

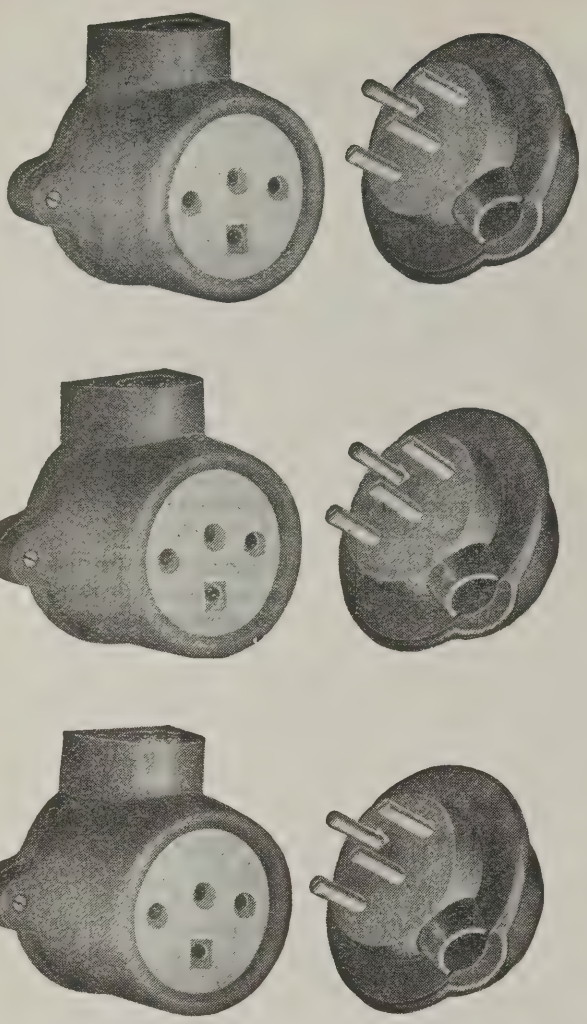
A SELF-FEEDING *Protective* CABLE CARTON

Every cable user will now welcome the new "Enfield" Self-Feeding Protective Cable Carton.

No other form of cable packing so completely protects the cable in transit, in stock, or on the job. The cable is freely withdrawn just as required, without kinking, whilst the remainder is completely covered, until required for the job.

The Carton consists of a reel having an outer covering of cardboard, divided into two parts, which remain attached to their flanges. The cable is withdrawn from between the flexible lips, which close as the cable is pulled off the reel.

Advantages.



1. *Cable kept clean and protected in transit, in stock and on the job.*
2. *Draws out without kinking.*
3. *Any lengths can be released without handling the Carton. There are no untidy odd lengths to return to stock.*
4. *The Cable always remains coiled under cover on the reel.*
5. *Can be run off a spindle if required, without damaging the protective covering of the Cable.*

The little more

Just a switch! Perhaps seldom used and yet—when required it *must* open with certainty. Or perhaps, it is used frequently and must stand up to such usage without overheating or breakdown.

The Cantie switch is a robust engineering job in cast iron. Technically it is excellent—for example, it has a much faster make-and-break than is general. It is unusually reliable—non-fracturing U-contacts, positive drive independent of the spring, and so on. It *is* good and looks what it is.

You will never regret the *little* more that buys a "Cantie."

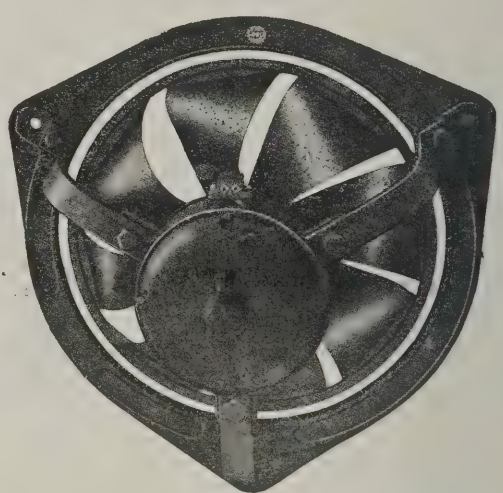
For *Coolness* Sake

it is essential to have a continuous supply of fresh air!

SUNCO ELECTRIC FANS

will ensure this. The 1927 season's range of SUNCO Fans covers all your needs—Desk Fans, Swivel and Trunnion and Oscillating Types—Ceiling, Ventilating and Exhausting Fans are all included in our stocks—ready for immediate delivery. Quality is as usual of the best, but prices are strictly competitive.

The Fan rush which is now due will bring you many enquiries. Have a small stock ready. *We are quoting special terms for quantities.*



Ref. No. D 2061.

SUNCO TABLE AND DESK FANS

Made in many different types and sizes at prices from **36s. each** (2b) for rigid base 10" direct current fans.

Ref. No. D 2061 is a heavy-pattern D.C. swivel and trunnion type fan, fitted with three-speed regulator in the base.

D 2060 12-in. blades 100 to 110 Volts £3 0s. (2b).
D 2061 12-in. blades 200 to 250 Volts £3 5s. (2b).
These fans are also available with 16-in. blades.

SUNCO VENTILATING FANS

are supplied in a wide range of types and sizes, having outputs from 600 to 15,000 cu. ft. per min., and for all circuits D.C. or A.C. Box blades are fitted on standard fans but three-way light or heavy-duty Propeller blades can also be supplied if required. The motor is mounted on a heavy cast-iron ring which greatly simplifies fixing.

The prices quoted for fans in our General Catalogue still hold good. We shall be pleased to forward additional copies of the Fan section only (List No. 461) if required.

HIGGS (HM) MOTORS
TRADE MARK
PROPRIETOR WALTER FHIGGS, MIEE
WITTON B'HAM.

A.C. D.C.

When looking through the long lists of second-hand machines one seldom sees a HIGGS MOTOR offered; the only conclusion one can come to is that, owing to the sound construction and excellent performance, there is always a ready market for them.

On the rare occasions that they are offered the price asked closely approaches to-day's new price.

This important fact should be borne in mind when purchasing.

Union Cables are the first Choice of Electrical Engineers who appreciate that reliability under all conditions is the first and only consideration

New Design Heavy Current TRUCK TYPE SWITCHGEAR

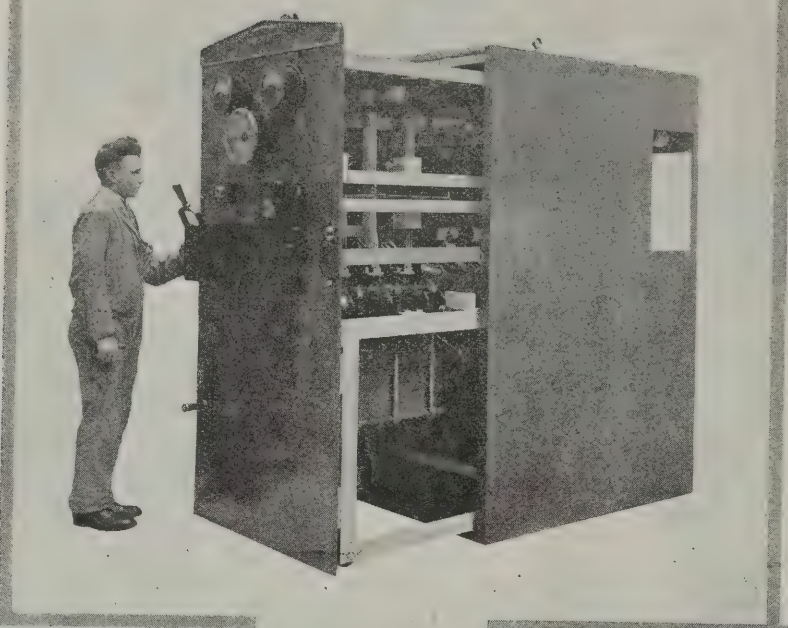

Fig. 1.

Fig. **1** above shows an equipment with the truck portion partially withdrawn. A side view of the truck is shown in Fig. **2**, and a rear view in Fig. **3**. In the latter, the two sets of isolating sockets in parallel are clearly shown, together with the air cooled synchronising potential transformer and oil tank raising and lowering mechanism.

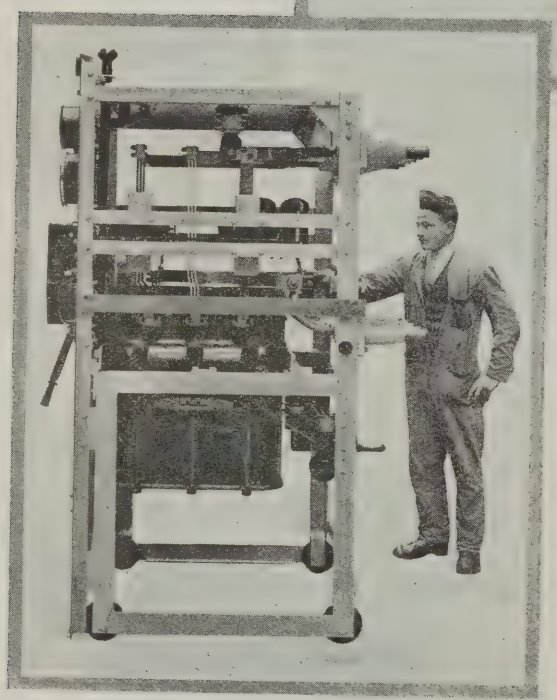

Fig. 2.

Fig. 3.

The use of truck type switchgear for heavy current low tension duty is increasing and a recent example is shown above.

Heavy section welded frames ensure rigidity and a mechanical rack out device enables one man to withdraw or plug in the truck portion.

Adequate contact area on the isolating features is obtained by the use of two sets of self-aligning isolating plugs and sockets in parallel.

The gear shown incorporates a type "S" 2000-amp. low tension oil circuit breaker with the F.P. patent supersensitive operating mechanism.

Full particulars gladly supplied on application to any of our branches.

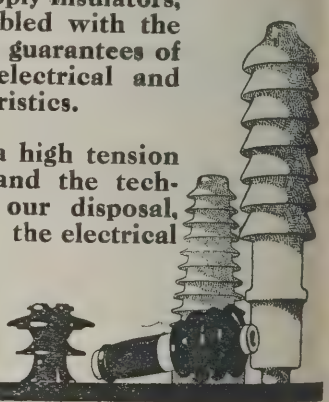
BUSHING INSULATORS



Size is a distinctive feature of extra high tension bushing insulators.

The question of how large, or rather how small, the body of porcelain used is a matter of scientific design. But only expert manufacture can produce the necessary vitrosity, strength and accuracy, and at the same time permit of the most economical supply.

This expert designing is an aspect of electrical porcelain development in which we specialise.

For the manufacture of insulators to customers' designs, we offer porcelain of unique quality. To those who prefer a complete standard we can supply insulators, designed and assembled with the metalwork, carrying guarantees of oil tightness, and electrical and mechanical characteristics.

Our works, our extra high tension testing equipment and the technical facilities at our disposal, are at the service of the electrical supply industry.

MIDLAND BUILDING AND ALLIED TRADES EXHIBITION

(including Public Works and Road Making Section),

BINGLEY HALL, BIRMINGHAM, SEPT. 5 to 17, 1927.

IN RESPONSE TO the general requests of Exhibitors at the first Exhibition two years ago, the Birmingham Chamber of Commerce (Inc.) has arranged to hold a similar display, on a still larger scale, in the coming autumn.

ALL ASPECTS OF Modern Building will be represented. The following is the Schedule of Exhibits :—

Building Materials.
Builders' Ironmongery and Hardware.
Architectural and Ornamental Work.
Constructional Steelwork.
Ferro-Concrete.
Sanitary Apparatus, Appliances & Fittings.
Contractors' Plant.
Shop, Bar and Restaurant Fittings.
Municipal Engineering and Equipment.
Road Making Plant and Materials.
Paints, Varnishes, Colours, Enamels, Stains, Polishes, Lacquers, Metal Powders, Wood Preservatives, Glues & Adhesives.
Mechanical and Hand Painting and Spraying Apparatus.
Decorating Materials, Wall-papers and Coverings.
Electrical, Gas, Oil and other Illuminating and Heating Plant and Fittings.

UNDER THE AUSPICES of the leading Architectural and Trades Associations.

Conferences on technical subjects and problems of the day will be held throughout the Exhibition in a Conference Pavilion specially erected for the purpose. Arrangements have also been made for the entertainment at Luncheon, day by day, of influential trade delegations.

THE greater part of available space having been booked in advance by Exhibitors in 1925

EARLY APPLICATION IS ESSENTIAL.

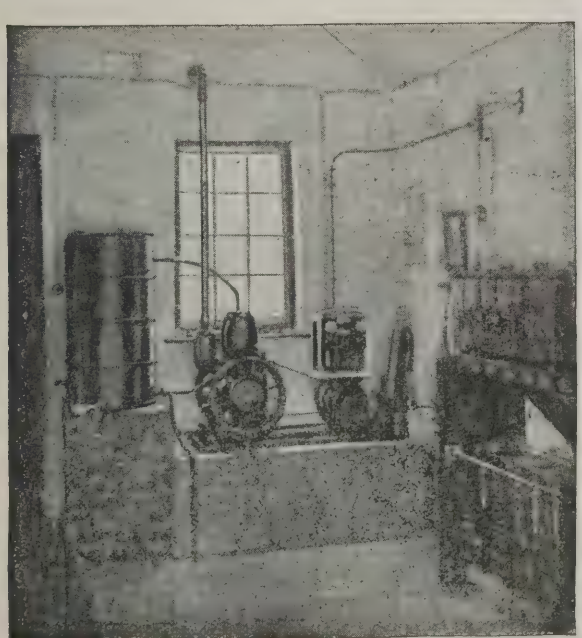
ECONOMY



"The Gleaners," after J. F. Millet.

JUST as the Gleaners reap the benefit of the last grain of corn, so users of Petter Oil Engines gain that extra economy in power per unit which puts these engines in a class by themselves.

This economy proceeds largely from the simplicity of their construction which brings about decreased initial costs and considerably reduced upkeep costs. This is especially noticeable when one compares our engines, built on the 2-stroke cycle with 4-stroke cycle engines. The fuel and lubrication costs of Petter engines are remarkably low.

Such qualities bring sales and it is significant that Petter Agents are to be found in every important town in the world.

The range of our products has recently been increased so that we now manufacture engines and oil-power electric generating sets from 1½ to 2,000 Horse Power—a proof in itself of our growing expansion. Our star is in the ascendant and the Agent who hitches his wagon to this star will be well advised.

A Petter-Light Installation.

PETTER-LIGHT

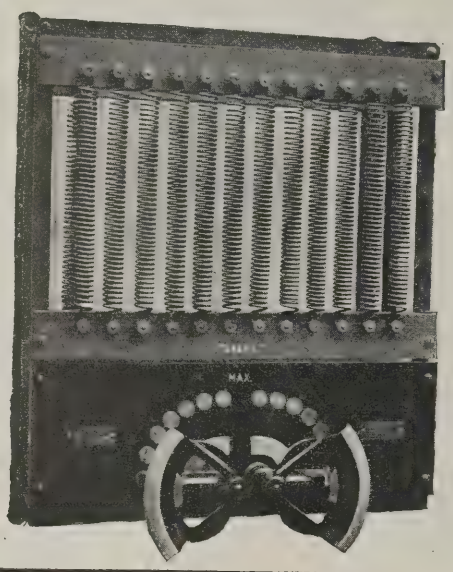
Petter-Light Electric-Generating Sets are not excelled by any other small power lighting plants for use in Country Houses, Factories, Shops, etc.

They are made in sizes from ¾ to 3 K.W. and work on petrol/paraffin with magneto ignition.

Our prices have recently been reduced and these lighting sets are sold from £80 and upwards, with batteries complete.

There is also a range of direct-coupled Petter-Light Plants.

For full particulars of the Petter Agency write to:



PETTERS LIMITED

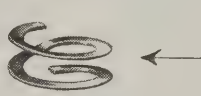
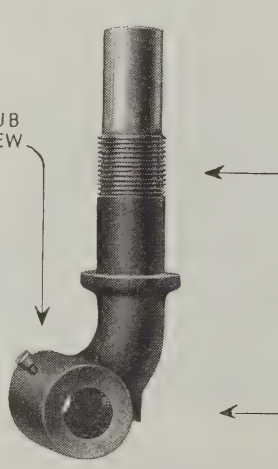
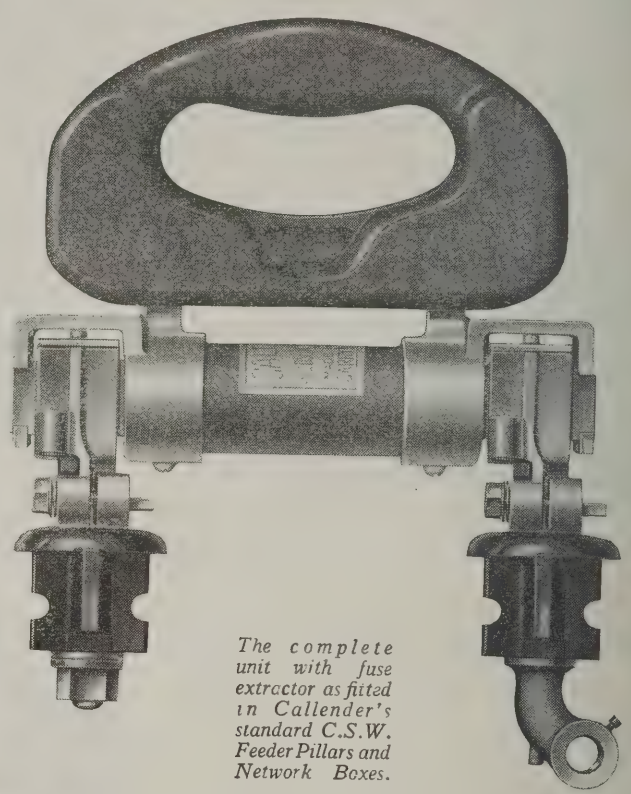
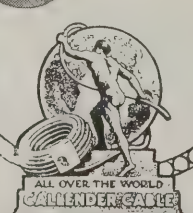
The CALLENDER-WATSON TYPE SPRING CONTACT

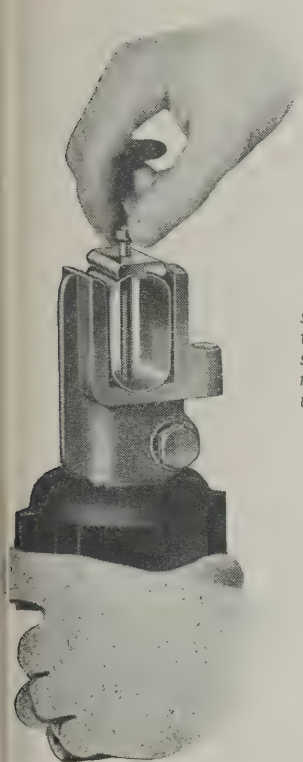
MANUFAGTURED UNDER PATENT No 157011.





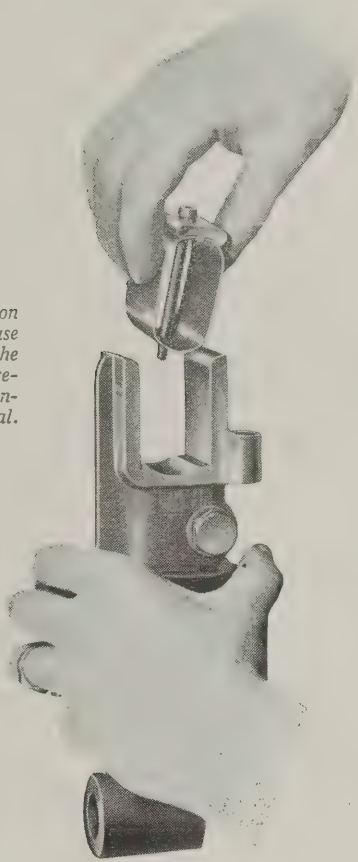




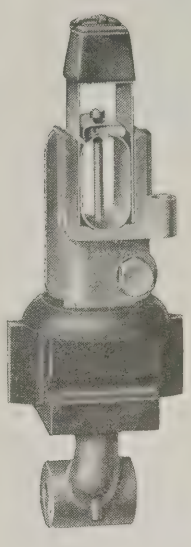


The complete unit with fuse extractor as fitted in Callender's standard C.S.W. Feeder Pillars and Network Boxes.

THE Callender Watson Type Spring Contact, evolved after months of experimenting, has now not only removed all the objections and prejudices engineers may hitherto have had against spring contacts, but provides considerable advantages over other types of disconnecting gear. With this type the ready disconnecting of links or fuses can be obtained without the delay and trouble of undoing nuts or screws. From the illustration showing the arrangement of the stalk and contact head it will be noted that the stalk is supported in the insulator by means of an internal nut, so that when the contact head is removed for any purpose there is no possibility of the stalk dropping out and making contact with the sides of the pillar body, or the bottom of the network Box.

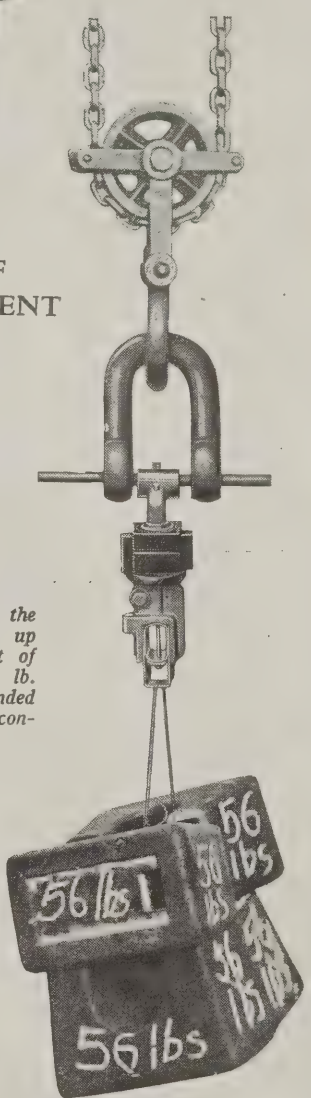


CALLENDER'S CABLE & CONSTRUCTION CO. LTD.
Hamilton House, Victoria Embankment, LONDON E.C.4
Telephone, 8903 Central. Telegrams "Callender" Ldn.



ILLUSTRATING ADVANTAGES OF THESE PATENT SPRING CONTACTS

This illustration shows the ease with which the spring clip is removed for cleaning or renewal.



EASY REMOVAL

This photograph illustrates the slight pressure required to push home the fuse contact, whilst the one below,

SCOPE OF ADJUSTMENT

demonstrates the adjustability up to the point of holding 4-56 lb. weights suspended from the fuse contact.

The chief advantages of the Callender Watson Type Spring Contact are:—

(1) The springs are easily removable.

(2) The pressure on the contact surfaces is adjustable.

(3) The spring when removed leaves a wide space between the contact jaws, rendering cleaning easy.

(4) The spring itself is not relied upon to carry any current.

(5) The spring is in compression, thus minimising fatigue in the material.

(6) Each side of the contact will carry the current applicable to the cable for which it is used, continuously without overheating, whether links or fuses are adopted.

ELLISON SWITCHGEAR

TRADE MARK

Ellison Draw-out Unit Type Switchgear in the Albion Motor Car Co.'s Works.

Controlling the Workshops of Britain

Ellison Switchgear is distinctive in both design and construction. Old types are imitated as being good enough, but experience teaches, and new Ellison types have been evolved *which retain the old reliable characteristics with improvements that still further lower installation and maintenance costs.*

Note how the supporting members of the above switchboard straddle the trench and leave a clear way for the cables. This is only one of the considerations that lead Engineers to specify "Ellison make."

GEORGE ELLISON

Works: **PERRY BARR, BIRMINGHAM.** 118

ELLISON No. "O" CIRCUIT BREAKER

TUFNOL and PLASTOL

These two high grade insulating materials—used exclusively on Ellison Control and Switchgear—can now be purchased for general use. Please write for full details and prices.

TUFNOL.—A new type of synthetic-resin-paper insulation, baked under hydraulic pressure and made up in the form of sheets, tubes, rods and other shapes.

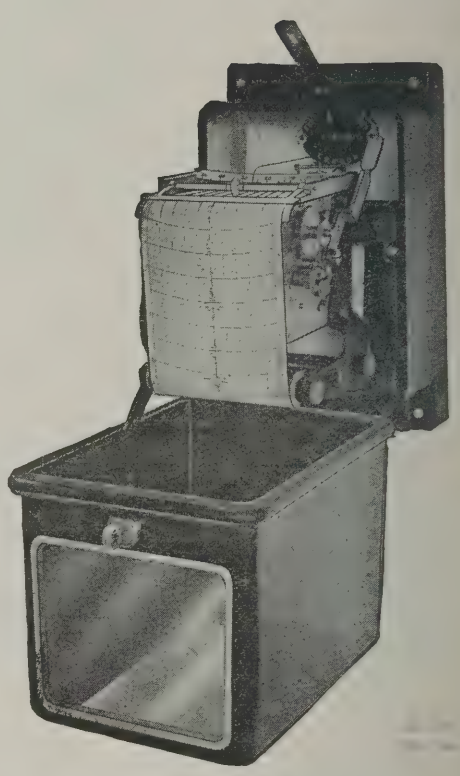
PLASTOL.—A plastic covering compound for protecting connections and joints as an alternative to tape; can be applied like putty and removed easily.

C

"INKWELL"

The Grapher that looks after itself—

INKWELL Graphers conform to British Standards Specification No. 90 and possess the following advantages over all pen pattern instruments.



THEY combine a constant ink supply with a continuous roll chart, thus securing uninterrupted records with a minimum of attention.

ACCURACY and sensitiveness are ensured by eliminating pen-to-paper friction.

THE supply of ink being self-adjusting and constant its unvarying weight results in equal accuracy at all points of the scale.

THEY occupy less space on the switchboard than any other Grapher and are much easier to manipulate.

THEY are supplied to record Amperes, Volts, Watts, Power Factor and Speed.

IMPROVED

Feeder Pillar Casings.

N.B.

Please give us your enquiries for odd sizes whether taller or shorter or

N.B.

with divided up interiors, &c., &c., also for Doors and Frames for Brick Chambers.

No. 1326. Registered Design.

We have brought out this excellent Feeder Pillar in the **seventeen** standard sizes as set out below in order to meet all ordinary requirements.

These Casings are of very nice appearance, are made up of thoroughly good castings, and are very efficiently ventilated. Each Pillar is provided with doors, hung on massive ornate malleable iron hinges pivotted on $\frac{3}{8}$ in. dia. Brass Pins, and each door is fitted with a good Brass Lock. Sizes up to and including Size 4 have their door openings closed in by single doors, the openings in the larger sizes being closed in with multiple doors. The underground root part of all sizes measures 15 inches high and can be made detachable at a reasonable extra.

YOUR ENQUIRIES SOLICITED.

HARDY & PADMORE, LIMITED,

ONLY ADDRESS: WORCESTER, ENGLAND.

8½-KW. for Lord Templemore, Upton House, Alresford, supplied to the order of Messrs. P. J. Driscoll & Co., Ltd., London, W.

8½ K·W FULLY AUTOMATIC.

These are the size plants (3½, 6, 8½ and 12 KW.) which you as a contractor will like. So does the customer and so do we.

The size enables an Austin plant to use crude oil with its extreme economy.

The cost of electricity is so low, that electric cooking and heating is eminently practicable. This means still further sales for you.

Now that you can give your customers such sets of such high economy, they have no excuse for waiting for a mains supply, which may be years in coming.

The magnitude of these jobs makes them worth tackling.

Write to us; we may be able to help you to put up a good proposition to farms and estates in your district.

Deferred Payments.

We can arrange for you to supply these plants on deferred payments. Full details of the scheme will be gladly sent on request.

DID YOU EVER

count the cost of maintenance of small cells on tripping, substation and stand-by circuits? Some of the leading Supply Companies have done so with the result that in every case

"NIFE" STEEL CELLS

have been installed. These all-steel cells are practically everlasting on stand-by and emergency circuits and are unaffected by idleness, over-charging, short circuiting, etc. They cost a little more to buy, but

FIRST COST IS LAST COST!

Write for full particulars.

CONVENIENCE

Points of Supremacy No. 3.—**CONVENIENCE.**

THIS quality can be applied to every point of the Vac-Tric De Luxe. **Light, Compact and Portable.** Mounted on 3-ball bearing, rubber tyred wheels, it operates without friction or effort. The dust container is enclosed in the cylinder, is easily emptied, and no dust can escape. The attachments, which are beautifully finished, make this cleaner so convenient and simple in operation that a child could use it with perfect ease. Easily adapted for "blowing" purposes, it runs satisfactorily on all voltages and on D.C. or A.C. Spares can be obtained in a few hours in London.

The Port of London

Number Four of a Series

FAMOUS THROUGHOUT THE WORLD

THE Port of London extends up the River Thames to London Bridge and presents an unrivalled spectacle of the forces behind Britain's sea-borne traffic. Great docks and wharves are everywhere in evidence between London Bridge and Gravesend.

At Woolwich, on the North Bank of the river, the cable factory of Standard Telephones and Cables Limited evidences the fact that the engineers of this great company are coping with the call for equipment which will serve to handle the electrically-borne traffic of the world.

From here, power cables of the latest type are continually being shipped to the remotest parts of the earth.

KELVINATOR *alone answers all these questions satisfactorily—— that is why you should SELL it*

The Question: What is its running costs?

The Kelvinator Answer: About one-fifth the cost of the ice-box method, and less than that of any other method of refrigeration.

The Question: Will it maintain the required correct, safe and dry temperature independently and without fluctuation?

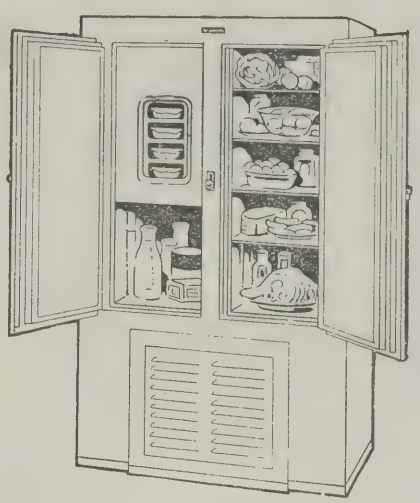
The Kelvinator Answer: Indefinitely.

The Question: Does it need a man to look after it?

The Kelvinator Answer: It needs no human attention of any kind.

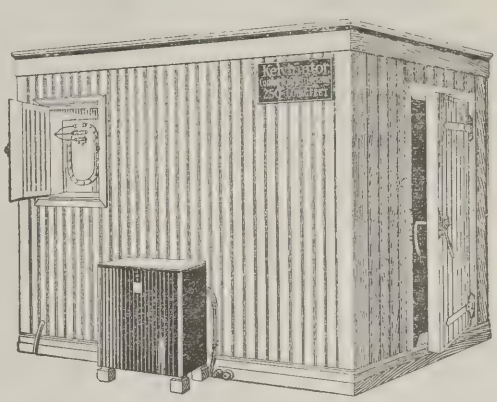
The Question: Is its mechanism as simple as it might be?

The Kelvinator Answer: Kelvinator's simplicity accounts for its unfailing efficiency.



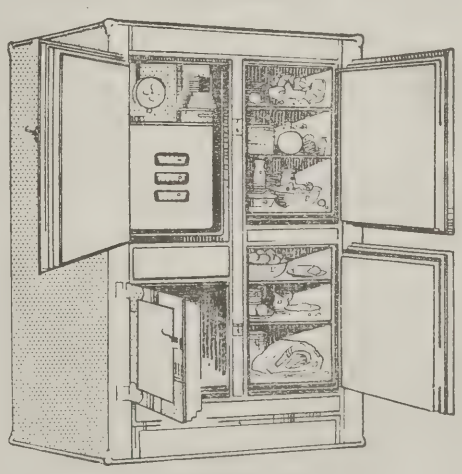
The Question: Can my existing ice-box be converted into a Kelvinator?

The Kelvinator Answer: Yes! If in good condition.



The Question: And can I adjust the temperature of the commercial Kelvinator to suit my own needs?

The Kelvinator Answer: Yes! Only the temperature of the household models is fixed between 40° and 50°—the safety zone of Kelvination.



Since the use of preservatives in food was made illegal by the Pure Food Laws, refrigeration has become *your* greatest profit-making opportunity. He who is the "first in the field" is going to reap the greatest harvest! Step in with Kelvinator!

THE WOOTTON BACKBOARD

The extra thickness in WOOTTON Meter Boards makes just that difference between the best and the next best. And for those who want full value the best only is sufficient. This ½" in thickness gives greater stability, greater security, greater all-round value.

Get the thicker board—every time!

WOOTTON & Co LTD — GENERAL & ELECTRICAL WOODWORK SPECIALISTS — PONDERS END MIDDX

PHONE ENFIELD 0700

As we are the actual manufacturers we are in a position to supply these boards in ANY size; although the very comprehensive range in our list covers most sizes required. The WOOTTON Carton contains—

12 Backboards, constructed of first quality 12½ m/m (½") birch plywood, round corners, varnished all over with two coats best shellac. Each board protected by grease-proof paper.
96 Porcelain Insulators.
48 2¼-in. × 10 Iron Screws.
48 1½-in. × 10 Rawlplugs.

In every WOOTTON Carton the insulators are threaded on a string and all screws and rawlplugs are enclosed in a separate cardboard container. *There are no loose accessories to come tumbling out when the carton is opened.*

Labour and Material British throughout.

From "Electrical Times," Feb. 3, 1927.

An Interesting Electric Heating Installation.

HITHERTO electric heating for large buildings has generally been regarded as an uneconomical proposition under the average conditions — including atmospheric and competitive agencies — obtaining in this country. It is a facile assumption to make but an increasing number of successful large scale electric heating installations clearly demonstrate its fallacy. A striking example in point is furnished by the new Stafford works of the British Reinforced Concrete and Engineering Co., Ltd., which were completed last May . . . . .

. . . ***It is interesting to note*** that electric storage water heaters are fitted both in the works and office lavatories.

These are of "Cumulus" Make.

Here is one of many reasons why you, too, should consider "Cumulus":—

****The full quantity of water heated can be drawn off*** at the maximum temperature, because the Heater is designed to prevent the cold water—admitted at the base—from mixing with the heated water and ***thus Reducing its Temperature.***

Send for Leaflets 60 CE and 61 AE. They are very interesting and contain curves which prove conclusively the remarkable efficiency of this waterheater.

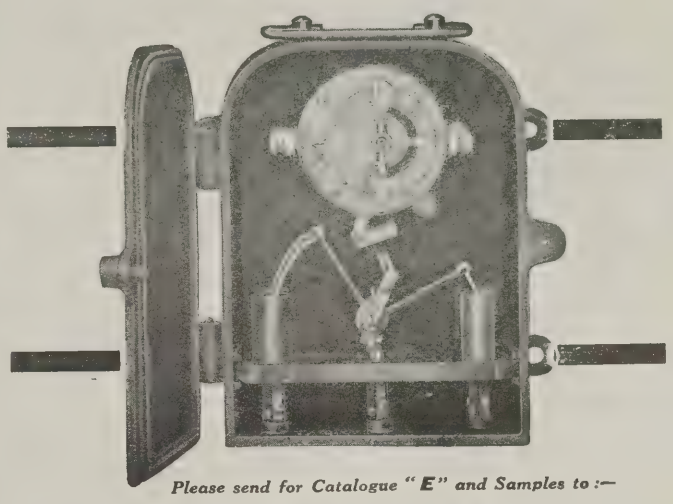
Lamps, Cable, Switchgear, Vacuum Cleaners, Fires, Fans, Motors.

& all Electrical Accessories at best Trade Prices.



Faithfulness of Performance

THE faithfulness of performance in Newbridge Time Switches is due in no small measure to the thoroughness with which each unit is inspected during the process of manufacture and assembly.

SO exacting and rigid are the tests on any Newbridge Time Switch that the slightest variation in workmanship or material results in rejection.

It is this attention to detail that has earned a reputation second to none for

NEWBRIDGE TIME SWITCHES.

Please send for Catalogue "E" and Samples to :—

THE HORSTMANN GEAR CO., LTD.,

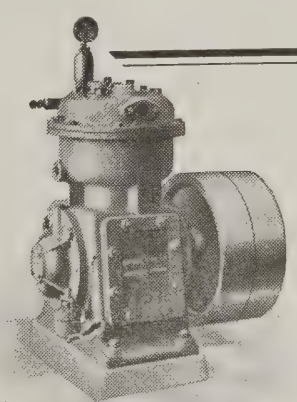
PLANT WELFARE

ELECTRICAL and other POWER PLANT

Power Plant is the heart of nearly every industry; its inadvertent stoppage is costly and vexatious; but periodical inspections minimise the possibility of stoppages.



In 50 years of "preventive" service the "British Engine" has created a technical organisation of a highly specialised character, thus satisfying the first requirement in Engineering Insurance, namely, DEPENDABLE SERVICE.

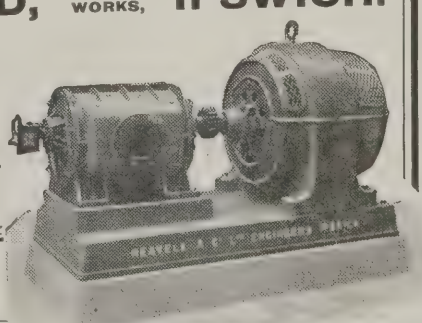
The Company has 170 Engineer-Surveyors, enabling prompt attention to be given to inspections even at busiest times. Repair work is closely supervised with a view to expeditious completion and efficiency. Provision for the cost of repairs is made by the Policy.

In aiming at safety, economy and efficiency in the working of plant, and immunity from accidental stoppage, the Company and its clients have a common objective.

BRITISH ENGINE
BOILER & ELECTRICAL INSURANCE Co., Ltd.

Head Office : **24, Fennel Street, Manchester.**

WE ARE SPECIALISTS IN THE DESIGN AND MANUFACTURE OF PNEUMATIC PLANT FOR ALL PURPOSES WITH



AIR AND GAS COMPRESSORS AND EXHAUSTERS

FOR ANY CAPACITY OR PRESSURE.

Members of the
C.M.A.

1899 to 1927

TWENTY-SEVEN years ago the Cable Makers' Association was founded, a recognition of the fact that Industria organisation by groups is necessary for the maintenance of high Industrial and Professional efficiency.

Since then nearly every group in the Electrical Industry has organised itself on similar lines, and the mutual co-operation of these groups has placed the Electrical Industry in the fine position it holds to-day in our National Economy. The Individual groups have benefited; and, above all, the public, the ultimate consumers, have benefited.

"PROVEN"

This means just what it says. We have done all the experimental work, just as we have always done with all Venner products, before asking the trade to sell—

THE VENNER SILVER GRILL

Loading only 600 watts but will do any cooking that can be done by grill or frying pan. Cooking space (oval) 12 ins. by 9½ ins.

A Godsend in districts where the cooking tariff is high or plant and mains incapable of dealing with heavy cooking loads.

A very handsome but thoroughly practical piece of apparatus listed at only—

£4 - 10 - 0

Every live contractor should have one of these in his showroom and a supply of folders for distribution to customers. Full technical and other details in our List No. 38.

This is an ideal time of the year to push the sale of these, so write to us NOW.

VENNER
SILVER
GRILL

"As good as a Venner Time Switch."

Advt. of Venner Time Switches, Ltd., 45, Horseferry Road, Westminster, London, S.W.1.

ZENITH

(REGISTERED TRADE MARK)

REGULATING RESISTANCES

Back of Board Type for Field Regulation, etc.

Simple construction

Ample rating

All mechanical parts entirely insulated

Reliable and easy to fix

Enable extremely fine regulation to be obtained

Single and Double Tubular types are manufactured in 10 sizes.

Front of Board Indicators showing position of slider at any point can be supplied

Wherever Resistances of any type are required, always insist on ZENITH productions

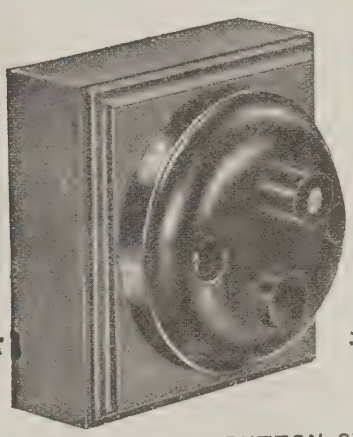
THE ZENITH ELECTRIC CO., LTD.,



(Formerly The Zenith Manufacturing Co.).

Sole Makers of the well-known "Zenith" Electrical Products.

Contractors to H.M. Admiralty, War Office, Air Ministry, G.P.O., L.C.C., etc.

ZENITH WORKS, VILLIERS ROAD, WILLESDEN GREEN, LONDON, N.W. 2.

Telephone: Willesden 4087-8. Telegrams: "Voltaohm, Willroad, London."

"ADNIL" EBOLITE PRESS-BUTTON SWITCH.

Shock Proof
Indestructible
Handsome

The ALL-INSULATED "Adnil" Switch, made from the unbreakable insulating material, Ebolite, and having no fragile porcelain parts, is very rapidly gaining in popularity. It is operated by a slight finger pressure either "ON" or "OFF." Moreover, it is easily and quickly wired, positive in action, and makes a quick break. Lastly, it is light in weight, handsome in appearance and remains unaffected by heat or chemicals.

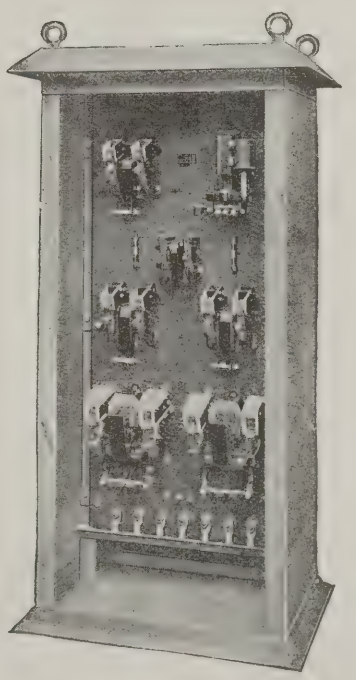
Power without adequate Control is waste.

The commercial use of electric power has been moving fast. To-day, motors alone do not make an efficient plant. Something more is needed—control apparatus that guides the work of motors—gets full return of efficient service, yet protects from damage due to mis-handling or mishap. The development of more efficient Motor Control has been one of the outstanding achievements of industry's electrical progress.

Look to the Motor Control equipment in your plant. Have you realised the additional profits possible through replacing obsolete Motor Control by



IGRANIC Automatic Control

No. 125. Multiple Contactor type Automatic Self-Acting Starter for starting large Direct Current Motors.

Igranic Engineers are ready to co-operate with plant engineers or consulting engineers in making a survey of your plant to see that Motor Control is correctly chosen for every kind of electric motor drive.

Write for List A. 296.

No. 1080. Automatic Time Limit Self-Acting Starter for controlling large Alternating-Current Motors.

PERFECT INSULATION

"ELO" gives perfect insulation—a piece 1/8th inch thick will successfully resist A.C. Voltages up to 40,000; special grades are made to suit higher voltages.

"ELO" is the world's finest insulator it is hard but not brittle—does not soften and will stand 4,000 to 5,000 volts per sq. in. pressure. It can be moulded or machined to fine limits.

The principal forms in which "ELO" is made are Finished Mouldings, Varnish, Resin and Moulding Powders. All have the same valuable characteristics.

"ELO"

REGD.

SYNTHETIC RESIN PRODUCTS.
BIRKBYS LTD., Liversedge, Yorks.

REX
ELECTRIC RANGES.
TYPE A3.

Dimensions $31\frac{1}{2}'' \times 26\frac{3}{4}'' \times 21\frac{1}{2}''$. Weight: 170 lbs.

Cooking Top of high-grade cast-iron.
Boiling Plates are machined to concave form, to ensure good contact with Cooking Utensil.
The 3-heat Snap Switches are of reciprocating rotary pattern, and can be turned in either direction.
Thermometer is fitted on door of Oven, and Ventilating Valve at back of Oven.
Heating Units, Frying Pan, Baking Plate, Grating, &c., can be easily removed when cleaning the Oven.
The Oven has rounded edges.

In 1868, the year of its first appearance, the Leclanché Cell was introduced into England by The Silvertown Company

To-day, Silvertown Leclanché Cells are used by the British Government and its Colonial Administrations; by most of the British Collieries; and by the principal Railway, Telegraph and Telephone Services throughout the world.

The efficiency of the Silvertown Leclanché Cell is due to the care taken in manufacture, to the materials employed, and to the means taken to avoid any but first-class cells leaving our Works.

They are particularly suited for all testing purposes, electric signals and bells.

"Silvertown" LECLANCHÉ CELLS

We make all types of Primary Batteries

Send us your enquiries.
